§1 The phrase γράφει γούν indicates that what follows purports to be a literal quotation. This passage is the only evidence for the quote, which is regarded as a dubium in VS and DK, because the formula γράφει γούν has virtually the same function as λέγει γούν, which is quite often used by S to attach a quotation to something else (see above at ch. 1.3 Commentary D(d)§2). And though γούν occurs several times in P it never serves to introduce a purported quote. It is therefore far from certain that the Heraclitean phrase should be attributed to A. Editors from Bywater to Marcovich have regarded it as truncated, but with some hesitation we follow the suggestion of Mouraviev T416. Perhaps however we should supply ἔστι γὰρ εἰμαρμένη πάντως (sc. καθ’ ἀνάγκην) and understand ‘fate in every respect agrees with (or: occurs according to) necessity’. Cf. phrases

like ps.Plutarch *De fato* 573B καὶ ἡ μὲν εἰμαρμένη πάντως κατὰ πρόνοιαν, ἡ δὲ πρόνοια οὐδαμῶς καθ' εἰμαρμένην. Possibly something like καθ' ἀνάγκην was omitted by predecessor of A to turn the phrase in to a properly obscure utterance. If εἰμαρμένη is the same as ἀνάγκη, ἀνάγκη is the same as εἰμαρμένη; for the latter see Theophrastus on Heraclitus (22A5 DK): 'he posits a certain order and a determinate period of time for the transformation of the cosmos according to a certain fated necessity (κατὰ τινὰ εἰμαρμένην ἀνάγκην)', *Phys.Op.* fr. 1 Diels, 225 FHS&G cited below, section E(b)§1.

Dührsen (1998) 115–116 argues that T's formula CAG 6.13 ἀνάγκην δὲ τὴν εἰμαρμένην καὶ οὗτος ὠνόμασεν derives from A and is to be preferred to the virtually unanimous text in P,S εἰμαρμένην, τὴν δ' αὐτὴν ὑπάρχειν καὶ ἀνάγκην, which is confirmed by Ioannes Lydus 4.81 (not cited by him). But this is to ignore the periphrastic *variatio*, often including added *verba declarandi* that is characteristic of T's manner of dealing with these excerpts. Immediately above in the same chapter CAG 6.13 T adds κέκληκε and ὠνόμασεν to the text of another lemma of the present chapter of A, namely §5. Compare further his version of ch. 2.13.1, where P,S have exactly the same phrase Θαλῆς γεώδη μὲν, ἔμπυρα δὲ τὰ ἄστρα, and T at GAG 4.17 enlarges to καὶ τοὺς ἀστέρας δὲ Θαλῆς μὲν γεώδεις καὶ ἔμπυρους ὠνόμασεν (the paraphrase of Ach §11, p. 19.23, Θαλῆς μὲν δὴ γῆνιν ἔμπυρον εἶπε τὴν τῶν ἀστέρων οὐσίαν, inserts another *verbum declarandi*). His ὀνομασθῆναι in the Anaxagoras lemma, ch. 2.13.3 at GAG 4.17, is not paralleled in P or S either. Or take his addition of κέκληκε at CAG 6.15 to ch. 1.19.1, and at CAG 4.18 to ch. 4.2.6, and see above, ch. 1.25 Commentary D(d)§3. So ἀνάγκη should not be attributed to Heraclitus' authentic vocabulary on the basis of this evidence.

§§3–5 The complicated problem of the relation between fate and necessity in Stoic texts is discussed by e.g. Sharples (2007c), who argues that it is difficult to find out whether or not Chrysippus identified Fate and Necessity, as the evidence is far from unanimous. The present commentary is not the place for an appropriate discussion of this issue. The difference between Fate and Necessity, which leaves room for 'what is up to us' (τὸ παρ' ἡμᾶς, more familiar as τὸ ἐφ' ἡμῖν), is argued in the famous passage at Cicero *Fat.* 39–45, partly cited below section E(b)§3, where in Cicero's translation Chrysippus is quoted verbatim; see esp. Bobzien (1999) 206–218. Here in §3 of our chapter this distinction is ascribed to the Stoics in general, whereas the opposite of what he worked hard to disprove (*aestuans laboransque*, as Cic. *Fat.* at Gellius *NA* 7.2.15 has it), namely that 'what is fated does not differ from what has been necessitated', is nevertheless ascribed to Chrysippus in our §4, just as e.g. by his critics, and this identification is also found with other Stoics, e.g. Seneca *Ep.* 101.7 *inexorabilis fatorum necessitas* = ἀνάγκη εἰμαρμένης, Marcus Aurelius 12.14. Among the

critics we may cite Velleius at Cic. *ND* 1.40 and 1.55—note the formula *fatalis necessitas* (cf. Cic. *Fat.* 20 *fati necessitas*, also found elsewhere)—, Plutarch at *SR* 1056C, AD fr. 29 Diels, Gellius *NA* 7.2.1–3, and Aristocles fr. 3 Chiesara, all cited below at section E(b)§3. It should be observed that the contrast between Chrysippus and the (other) Stoics in the next chapter is the opposite of that in the present chapter, for at ch. 1.28.3 Chrysippus speaks of Logos and Providence, whereas at 1.28.4 the (other) Stoics posit the ‘inviolable concatenation of causes’ (if we may assume that being ‘inviolable’ is equivalent to ‘being necessitated’). The position of Zeno in §5 of in the present chapter is close to that of ‘the Stoics’ in §3.

§§3–4 According to Alexander of Aphrodisias *Fat.* c. 23, p. 193.4–8 (cited below at section E(b)§§3–4), the Stoic ‘weaving together’, or concatenation (συμπλοκή, ἐπιπλοκή), of causes belongs with the οὐσία τῆς εἰμαρμένης, so would be more pertinent to the next chapter, 1.28 Περί οὐσίας εἰμαρμένης (where at section E(b)§3 we cite this witness again). For the meaning of the rather rare word ἐπιπλοκή see the rhetorician Rutilius Lupus, cited section E(b)§4.

§3 For the phrase Πλάτωνι ἐμπερῶς cf. ch. 1.7.23 ὁμοίως Πλάτωνι (only in S and the only parallel for a name-label in the dative). Because of the purported similarity with Plato we have to reject Ioannes Lydus’ συνειμάρθαι, which introduces the Chrysippean doctrine of the *confatalia* (‘co-fated’, Cicero *Fat.* 30) attested in the verbatim fragment from Book 2 of his Περί εἰμαρμένης quoted by Diogenianus at Eusebius *PE* 6.8.27–30 (*SVF* 2.998).

§4 Fortunately the missing part of Chrysippus’ definition in S can be supplemented from T. Wachsmuth’s attempt to include words from the definition in Gellius *NA* 7.2.3 (note the incorrect reference in his apparatus, p. 78) is misguided. τὰ μέρη will refer to parts of the causal chain, or rope; compare ὁ καθ’ ἕκαστα διορισμός in the explanation of Atropos at *DG* p. 324a2–4 (S 1.5.15, p. 79.15–16), that is, in the latter part of 1.28.3 Diels, which as we believe derives from AD (see at 1.28 Commentary A).

§5 (1) In this paragraph we have the only mention in this chapter and the following of the often-found identification of Fate and Nature, for which see the fragment of Iamblichus’ *Letter to Sopatros* at S 1.5.18, p. 81.8–9, with the rich comments of Taormina–Piccione (2010) 196–198 and 347–349. (We have assigned the Chrysippean doxai at *DG* 323b21 ff. to AD, see at ch. 1.28 Commentary A.)

(2) Though fate is identified with Nature, we are not told in what way fate works in the world of nature; for this information we must turn to the next chapter on the οὐσία of fate. Note, however, that Alexander of Aphrodisias includes the Stoic concatenation of fate under the οὐσία of fate (see below, section D(d)§§3–4), just as happens at ch. 1.28.4 below. We have noted a similar frustrating ambiguity (with some consequences for the interpretation of

chs. 1.21–22) in Sextus' handling of the distinction between time and the οὐσία of time, see above at ch. 1.21 Commentary D(c). So perhaps we may believe that fate's moving 'matter in the same respect and in the same way' pertains to the eternal recurrence of same in the cosmic cycle, cf. Mansfeld (1979) 163–165. Zeno would have adapted a well-known Platonic formula pertaining to the Ideas.

(3) Περί φύσεως: this title does not occur in Zeno's bibliography at Diogenes Laertius *V.P.* 7.4; it is perhaps an alternative or *lectio facilior* for Περί τοῦ ὅλου (*V.P.* 7.4) or Περί οὐσίας (*V.P.* 7.134) through association with the word φύσιν *ad finem* (Mansfeld 1979, 169 n. 106).

e Other Evidence

(1) Especially the accounts in ps.Plutarch and Calcidius mentioned above at section D(a), and also a series of chapters in Nemesius, namely *NH* c. 35–40 are to be noted. Proclus in *Tim.* 3.271.29–275.23, commenting on the νόμους εἰμαρμένους of *Tim.* 41e, provides a quasi-doxographical overview of views on fate in relation to nature (cf. above, section D(d)§5), namely those of Alexander *Fat.* c. 6, Aristotle (rather forced), Theodore of Asine (test. 32 Deuse), Porphyry (—), and ps.Aristotle *Mu.* c. 7. Proclus then expounds the true doctrine and his own view (useful notes in Festugière 1968, 5.147–151). See further ch. 1.28 below, the companion piece of the present chapter. Much material is found in Pease (1955) 273–274, 339–341.

(2) The theme was *en vogue* in Hellenistic philosophy, and beyond. Calcidius in *Tim.* c. 142 speaks of 'an important and difficult matter, much discussed among the ancients and continuing even today'. As Latin equivalents we have Cicero's mutilated treatise *De fato* and a piece by Ambrosiaster. No doubt there are more examples. Of course the contents of these works are not restricted to the existence of fate.

E Further Related Texts

a Proximate Tradition

General texts: (NB: pertains to both ch. 27 and ch. 28) Cicero *Fat.* 39 *ac mihi quidem videtur, cum duae sententiae fuissent veterum philosophorum, una eorum, qui censerent omnia ita fato fieri, ut id fatum vim necessitatis adferret, in qua sententia Democritus* (68A66 DK), *Heraclitus* (T 305 Mouraviev), *Empedocles* (—), *Aristoteles* (? Anaxagoras prop. Karsten, cf. Plu. *An.Procr.* 1026B, see above ch. 1.25 section E(b) General texts) *fuit, altera eorum, quibus viderentur sine ullo fato esse animorum motus voluntarii, Chrysippus* (SVF 2.974) *tamquam arbitrer honorarius medium ferire voluisse, sed adplicat se ad eos potius, qui necessitate motus animorum liberatos volunt; dum autem verbis utitur suis, delabatur in eas difficultates, ut necessitatem fati confirmet invitus. Seneca Ep.*

16.4–6 *dicet aliquis: 'quid mihi prodest philosophia, si fatum est? quid prodest, si deus rector est? quid prodest, si casus imperat? nam et mutari certa non possunt et nihil praeparari potest adversus incerta, sed aut consilium meum occupavit deus decrevitque quid facerem, aut consilio meo nihil fortuna permittit'.*

(5) *quicquid est ex his, lucili, vel si omnia haec sunt, philosophandum est: sive nos inexorabili lege fata constringunt, sive arbiter deus universi cuncta disposuit, sive casus res humanas sine ordine inpellit et iactat, philosophia nos tueri debet. haec adhortabitur, ut deo libenter pareamus, ut fortunae contumaciter; haec docebit, ut deum sequaris, feras casum.* (6) *sed non est nunc in hanc disputationem transeundum, quid sit iuris nostri, si providentia in imperio est, aut si fatorum series inligatos trahit, aut si repentina ac subita dominantur.* **ps.Plutarch**

§5 A 1.11.7 οἱ Στωικοὶ τὸ πρῶτον αἴτιον ὥρισαντο κινητόν.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

(1) The witnesses are the same as for the preceding chapter, which is its companion piece; with the important exception that G includes the present chapter as his single one on fate (so ch. 1.27 is lacking) and retains all five doxai. For the P tradition we have P^B, Q, G and the paraphrase of Ioannes Lydus (complete except for P₄).

(2) In addition S has all doxai except P₄ (now §4 in A), viz. in his order §1, §2, §5, and §3. See further section A(4) below.

(3) Of this chapter T records a phrase of §3 plus §4, which are his nos. 4 and 5.

(4) §3: The doxa of Chrysippus in S is considerably longer than its equivalent in P and is not corroborated by T. At M–R 1.253–254 (= M–R 3.326) we have argued that the final lines of the doxa, S 1.5.15 p. 79.8–20 (quoted below at section E(b)§3) printed by Diels as part of the paragraph in the b-column of *DG*, with their interesting etymological content, are more likely for stylistic reasons to have been excerpted from AD than A, so we do not include them in our

reconstruction of A. This type of coalescence is found more often in the *Anthology*, see Diels *DG* 75 n. 2, M–R 1.249–254, and Jeremiah at M–R 4.286 and 353. (Von Arnim at *SVF* 2.913 assigns the whole of S p. 79.1–20 to S only, neglecting the parallel of the first section in P, so goes too far in the other direction.) This section of the paragraph has much in common with Diogenianus at Eus. *PE* 6.8.8–10 (*SVF* 2.914, see section E(b)§3), a text copied *from Eusebius* by T at CAG 6.11–12—that is, interpolated by him a little before his excerpts from A 1.25–29 at CAG 6.13–15, while it would have been much easier to copy from A if it had been there! So one has to acknowledge that he did *not* find it in A. When this is added to the stylistic peculiarities of the text, the argument for exclusion from A may be considered settled. By placing the Chrysippus lemma at the end of his series of excerpts from chs. 1.28–29, he facilitated the coalescence of material from A with material from AD. The quotation from Chrysippus *On Definitions* in A may have inspired him to look for similar evidence elsewhere, though in other cases he did not need such prompting.

(5) A similar conclusion may be suggested for the beginning of §3; perhaps, for we cannot be certain, as S's ἀποφαίνεται (two more instances in S: at p. 232.35 for A 3.3.10 and p. 472.12 for A 4.8.3) is paralleled at p. 79.5 in P for A 4.8.3, and the section μεταλαμβάνει ... ἐτέρας ἐπιβολάς (p. 79.8–12) is not incompatible with A's manner. But instead of P's single brief reference 'and again in *On Definitions*' followed by three definitions shared by both sources, S attributes the definition with which the lemma begins in both sources at §3[2] to 'Book 2 of the *On the Cosmos*', and the three definitions that come next at §3[2–5] to 'Book 2 of the *On Definitions*', the '*On Fate*', and 'other works'. This seems to be excessive for A and more germane to AD's mode of presentation, cf. M–R 1.253–254, Mansfeld (2002a) 61 = M–R 3.408, n. 111. So S presumably coalesced A and AD already at the beginning of 1.5.15, p. 79.1–8 too; cf. above, critical apparatus to §3.

(6) §4. The lemma, preserved in both P and T, is missing in S, this time without compensation from AD. Instead he adds the final two lemmata from ch. 1.27 (Zeno, Antipater). He may have thought that he had enough Stoic doxai with specific name-labels, and so decided to delete the general doxa §4. Whatever the reason, this is one of the five significant cases of P and T in agreement against S (see *Introduction*, section 2.5 with n. 42).

B Proximate Tradition and Sources

See at ch. 1.27 above at Commentary B.

C Chapter Heading

Attested in both P and S, and of the standard umbrella type 'about x', περὶ τοῦ δεῖναι (cf. above, ch. 1.3 Commentary C). The series of chapters 1.9–29 (plus 1.30)

on the foundational concepts of physics are without exception introduced by headings of the umbrella type. In the present chapter we note a specialized version of the standard type through addition of the term οὐσία. The precise heading Περί οὐσίας εἰμαρμένη should denote some sort of meaningful distinction from that of the previous chapter, 1.27 Περί εἰμαρμένης. Compare ch. 1.22 at Commentary C, on the distinction between 1.22 Περί οὐσίας χρόνου and 1.21 Περί χρόνου (with a preliminary account of parallel *Placita* headings). The distinction between fate according to ‘activity’ (ἐνέργεια) and fate according to ‘substance’, or ‘essence’ (οὐσία), which is of prime importance in the Platonizing expositions of both ps.Plutarch *De fato* and Calcidius, cannot easily be reconciled with that between the previous chapter and the present one; see below, section D(d) general points. What we have here, rather, is a distinction between nominal definitions of fate in ch. 1.27 and of fate qua physical entity in ch. 1.28 (esp. §1 σπέρμα, §2 λόγος, §3 δύναμις πνευματική); see at ch. 1.27 Commentary C.

D Analysis

a Context

See above ch. 1.25 at Commentary D(a).

b Number–Order of Lemmata

(1) See above ch. 1.27 at Commentary D(b) for the problems thrown up by the witnesses and S in particular. For the present chapter the number and order of the lemmata are hardly in dispute, although §3 could perhaps also have been accommodated in ch. 1.27. For reasons that we try to explain at section A(4) above, S postpones the long Chrysippean doxa combined from A and AD until the final place in his doxographical excerpts. Otherwise all three witnesses agree in their ordering of the five doxai to the extent that they retain them (only P, it seems, is complete).

(2) It is worth noting that there is a sort of correspondence between chs. 1.27 and 1.28 in that both end with a theological doxa.

c Rationale–Structure of Chapter

(1) *Diaphoniae*. The three doxai assembled in §§1–3 are also concerned with fate as *logos*, or *Logos*, on a gliding scale and in chronological sequence. In contrast §§4–5 not only are not explicit about the physical role of fate, but also no longer include *logos*. Furthermore §2 is opposed to §1 in that this *logos* is said to be eternal for Plato, whereas it is, in the guise of fire, the origin of cosmogony for Heraclitus. There is no reference to cosmogony in §§3–5 either, so these paragraphs too are opposed to §1, although the eternity of the equiva-

lents of fate is not mentioned. Finally there are differences of opinion among the Stoics of §§3–5, though what is in §4 is an addendum to §3 rather than a critical response to it.

(2) The view of Posidonius in §5 is the maverick and so is appropriately listed at the end, as in contrast to the others he is said to locate fate not in the primary and dominating position, but only as a third factor, after Zeus and nature.

d Further Comments

General Points

(1) *Nominal definitions.* At ch. 1.27, Commentary C, we pointed out that the definitions found there have a general and conceptual character. The first three paragraphs of the present chapter are about the role of fate in the universe (§1, §2, §3), or the cosmos (§3 again), so clearly belong with *physics*. This may be thought to imply that we are faced with what the other ps.Plutarch and Calcidius call the ‘activity’ of fate, and not with what these other authors understand its οὐσία to be (cf. at section C above). §§3–4 lack this physical application, but perhaps this is implied after what has been expressed in the previous three paragraphs. On the other hand, while Plato on fate as the eternal *logos* and law of the nature of the universe is located at §2 of our present chapter on the οὐσία, this same Plato on the ‘laws applying to the nature of the All’ belongs with the ἐνέργεια of fate according to ps.Plutarch *Fat.* c. 1, 568C. Plato’s view, moreover, is said to have been ‘roughly sketched’ by him (τὸ πω ὑπέγραψεν); accordingly, this first account of the actuality of fate, a cento of Platonic citations, is of a conceptual nature, and the exposition of the real nature of this actuality is still to follow. This characterization is not found in Calcidius’ parallel version, or in Nemesius. For nominal definitions and their role in the *Placita* see above, ch. 1.9 Commentary D(c) and (e)(2).

(2) As noted before, this distinction between fate in actuality and its οὐσία, which prevails both in the ps.Plutarchean *De fato* and the account of Calcidius and could be a later development, is not paralleled in A. Finally, according to ps.Plutarch and Calcidius the οὐσία of fate is the tripartite World Soul consisting of (1) the sphere of the fixed stars, (2) the spheres of the planets, and (3) the sphere below the moon. Of this view there is no trace whatsoever in our *Placita* chapters either. Accordingly, just as with chs. 1.21–22 and the parallels in Sextus Empiricus, so also with chs. 1.27–28 and the parallels in ps.Plutarch and Calcidius there is no overall agreement as to structure, some shared features notwithstanding.

See also above ch. 1.27 at Commentary D(d) general points.

Individual Points

§1 In the description of the activity of the *logos* the phrase τῆς οὐσίας is omitted by G and Ioannes Lydus and might seem unnecessary. But S records οὐσίας without the article and the awkward repetition of οὐσία in a different sense makes it the *lectio difficilior*.

αἰθέριον σῶμα as a rule pertains to the so-called fifth element. The fire of this thoroughly Stoicized Heraclitus is called αἰθέριον σῶμα, which is not unparalleled in a Stoic context though more usual as a formula for Aristotle's fifth (or first) element. The circular movement of the fire, or aether, is transposed into one directing the cosmic cycle. The divine seed responsible for the cosmic cycle is of Stoic provenance.

§§3–4 The present contrast between Chrysippus and the other Stoics is the opposite of that in the previous chapter. Chrysippus now speaks of *Logos* and Providence, while 'the (other) Stoics' posit the 'inviolable concatenation of causes'. But at 1.27.3–4 'the Stoics' were said to hold that 'some things are fated (for us) and others not fated', while Chrysippus was said to identify 'what is fated' with 'what has been necessitated'. The phrase λόγος τῶν ἐν τῷ κόσμῳ προνοία διοικουμένων, shared by P, S, and T (and paralleled in Nem) certainly goes back to A.

§3[6] τάξει in the dative with διοικητικὴν is awkward, but must be retained. τάξιν in G and Ioannes Lydus smoothes the text but slightly alters its meaning, while Meineke's emendation τάξεως is otiose. Q may have read καί between the two nouns, but it may also be part of a smoothing process on his part.

§3[7–9] There is considerable variation in the mss. in relation to the triple description of fate here. It is best to take all three as based on the role of λόγος, as found in S, with the variant νόμος in P^{B(I,111)} perhaps introduced under the influence of §2, with the different reading in P^{B(11)} being the result of confusion.

§4 G reads οἱ ἄλλοι Στωικοί here, whereas all the other witnesses read οἱ Στωικοί. Given that the previous doxa was attributed to the celebrated Stoic Chrysippus, the reading in G makes excellent sense and was adopted by Beck (1787) 36 for P, though he places ἄλλοι in square brackets. It is a difficult decision. There is only one real parallel for a named member of a school being contrasted with other members of a school, but it is imperfect: at ch. 2.15.1–2, where Xenocrates (not a Stoic, but claimed to be an inspiration for them at ch. 1.7.21) is followed by οἱ ἄλλοι Στωικοί in P,S. The phrase (οἱ μὲν) ἄλλοι as name-label is rather common in G (10 cases), compared with P (8), S (11), and T (3). So he may have easily added the qualification himself. Since S omits the second doxa and T is too skimpy to help, sound methodology dictates that we must record what we deem to be the correct reading in P. Given that G regularly has superior readings to P^B and Q and his reading makes superior sense, it is justified to follow

G, as we have done in our text above. A further argument in favour is that in the previous chapter (not excerpted by G), namely at ch. 1.27.3–4, Chrysippus is contrasted with οἱ Στωϊκοί, although there the word ἄλλοι is lacking.

§5 A different order is found in the parallel at Cicero *Div.* 1.125, see Theiler (1982) 2.300.

e Other Evidence

Especially the accounts in ps.Plutarch *De fato* cc. 1–6 and Calcidius *in Tim.* cc. 142–190, and also Nemesius *NH* cc. 35–40, are valuable parallels. As to the differences with those sources concerned with the οὐσία of fate that have been pointed out above, one should bear in mind that A and his tradition are earlier than the lost source of the others. It is only natural that views about the activity and substance of fate underwent a further development. This apparently helped to overcome the unsatisfactory ambiguities of the situation represented by our chs. 1.27–28 (and 1.25–26).

Also compare our comments on the companion piece of the present chapter, ch. 1.27.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

(1) The chapter is quite well attested in all three major witnesses, but there are complications in the evidence of S. In the P tradition G only preserves two of the four lemmata found in P^B and Q, while Ps takes over only snippets. S spreads the material he drew from A over two short chapters, namely §§1–2 (plus a Theophrastus lemma) in ch. 6 'On chance or the spontaneous' and §§3–4 in ch. 7 'That the course of chance is not calculable'.

(2) T includes limited but valuable material from A's chapter in his broad-brush survey of Hellenic views on necessity, fate and chance; cf. above, *General Introduction*, section 2.5, and also Mansfeld at M–R 4.78, 181.

(3) Difficulties are caused by S, who cites rather more than P and in so doing includes material, the origin of which is difficult to determine. His evidence must be examined in detail. In part our present conclusions are different from our earlier efforts.

(a) At ch. 1.6.17a, p. 87.17–20, S cites the Platonic doxa (P₁S₂) in a fuller form than is found in P, followed by the first two lines of the Aristotelian doxa (P₂S₃), in exactly the same order as in P, so these two texts are clearly lifted from A as a block.

(b) The second part of this Aristotelian doxa (S₁P₂) is inserted at p. 87.9–16 by S *before* the Platonic doxa (P₁S₂), with a necessary addition of the name-label. This too is quoted in a fuller form than is found in P. Since he has called his chapter 'On chance or the spontaneous' and has already introduced the terms

in the poetic quotes in his ch. 6.1–16, S apparently wished first to clarify the difference between them, for his coalesced section of doxai from A 1.29 now begins with διαφέρειν δὲ τῆς τύχης τὸ αὐτόματον instead of the Plato doxa on τύχη alone. His addition of τὴν τύχην ἀπεφαίνετο to the Plato doxa (S2) shows that from now on he no longer deals with the αὐτόματον.

(c) After the first two lines of the Aristotelian doxa (P2,S3), he appends another eight lines (p. 87.23–88.6, καὶ ὑποθέσεις ... τεταγμένοις) on principles and causes not in P that cannot be regarded as certainly derived from A. This type of coalescence is found more often in the *Anthology*, see Diels *DG* 75 n. 2, M–R 1.249–254, and Jeremiah at M–R 4.286 and 353. Diels, however, prints them in §2. At M–R 1.254 and 3.326–327 we argued that they more likely reflect the more discursive approach of AD, and still believe that this is the more likely attribution. We have thus excluded them from our text. The inverted order of the final words of the first two lines of the Aristotelian doxa (P2,S3) in S (ἄστατον καὶ ἄδηλον) as compared with P's ἄδηλον καὶ ἄστατον betrays the seam.

(d) After a quote from Plato *Leg.* 4 709a–c at 1.6.17b, S continues at 1.6.17c p. 89.2–5 with a doxa attributed to Theophrastus, which commences with the words Θεόφραστος προσδιαρθροῖ ταῖς αἰτίαις τὴν κατὰ προαίρεσιν. The rare verb προσδιαρθρέω is also found in S at 2.7.6a, p. 2.76.1 in an ethical doxography from AD, and elsewhere in extant Greek literature before the fourth cent. CE only at Anon. in *Theaetetus* p. 56.36 Bastianini–Sedley. There are no other doxai in A directly reporting Theophrastus' views (if our reconstruction of ch. 2.20 is accepted; at A 1.prooem. 3 his name is conjoined with that of Aristotle). It is very likely, therefore, that this brief report is taken from AD, who is excerpted a few pages later in the chapter on time. Departing from Diels *DG*, we have not included it in our text. See further M–R 1.254 and 3.327.

(e) After the Theophrastean report there is a very brief and no doubt incomplete doxa attributed to Epicurus, but differing from the doxa cited later at S 1.7.9a. Since its contents are unexceptionally doxographical and run parallel to the doxa of Anaxagoras etc. at §5, a place must be found for them in our reconstruction. There are two possibilities. (i) The words can be attached to the Epicurean doxa §3. Its two parts would then be parallel to those in the following doxa §4. (ii) They can be added as a further doxa after §4. They would then make a contrast with the second part of that doxa. Although it is not uncommon for two doxai to be ascribed to the same philosopher in a single chapter (cf. e.g. chs. 2.13, 2.20, 2.24), we have chosen the former and simpler option, deviating from Diels *DG*, who simply juxtaposes them in the order found (in separate chapters) in S, see immediately below at section A(f). We have filled out the doxa following the suggestion of Usener (1887) 253, although the verb γίγνεσθαι may be unnecessary as the formulations at chs. 1.25.2 and 1.25.4 indicate.

(f) In the next chapter 1.7.9a S then cites a brief doxa ascribed to Epicurus, similar in form to the first parts of the other three doxai in P. It certainly derives from A.

(g) Next S cites the final lemma in P in an identical form to that in P. A difficulty here is that P and S both independently of each other have just the name-labels Anaxagoras and the Stoics, whereas T adds the name of Democritus between the two others. We follow Diels and Luria in accepting the additional attribution. The doxa is certainly compatible with Atomist thought (cf. Aristotle *Phys.* 2.4 196b6–7 (68A70 DK); *Met.* Γ.5 1009b7–10 (68A112 DK), note ἄδηλον at b10).

(h) Finally S cites a brief aphoristic description of chance: τύχη ἀτάκτου ἐνεργείας ἐστὶ προσηγορία. Lacking a name-label, this sentence does not fit in the chapter and should be set aside. It may be related to the Hermetic definition at S 1.41.1, l. 118 τύχη φορὰ ἀτακτος, ἐνεργείας εἰδωλον, δόξα ψευδής.

(4) We may conclude that, although S adds some material to P in three of the four doxai, P has preserved the basic structure and thought of the chapter. It is very likely he had no more than the four doxai preserved in P.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The proximate tradition is particularly rich. It consists of the largely parallel accounts in ps.Plutarch *Fat.* c. 8 and Calcidius in *Tim.* cc. 158–159, to some extent paralleled in Nemesius *NH* c. 33 (cited as a *testis secundus*) and Alexander of Aphrodisias *Fat.* cc. 7–8. The final note of §4 is also paralleled in the proximate tradition. See Gercke (1886).

(2) *Sources.* §2 has been abstracted from two successive chapters belonging to the argument dealing with τύχη and τὸ αὐτόματον in Aristotle's *Physics*, as Diels already noted (for additions to this material by S see above, at section A). At *DG* 215 Diels includes ch. 1.29.2 (29.2–3 in his numbering, including the section we attribute to AD) among his sparse examples of a close reading—according to him by A—of the text of Aristotle's *pragmateiai* ('[i]psius Aristotelis doctrina ... ex accurata eius lectione hausta', cf. chs. 1.9.1, 1.23.2, 4.8.6, 4.9.3, and 5.3.1 at Commentary B), and next refers to *Phys.* 2.5 197a5–10 and 2.6 197a36. It is at least clear that §2[5–6] Ἀριστοτέλης αἰτίαν κατὰ συμβεβηκός ἐν τοῖς καθ' ὁρμήν ἕνεκά τινος γιγνομένοις ἄδηλον καὶ ἄστατον has been literally abstracted from *Phys.* 2.5 197a5–10 δῆλον ἄρα ὅτι ἡ τύχη αἰτία κατὰ συμβεβηκός ἐν τοῖς κατὰ προαίρεσιν τῶν ἕνεκά του. ... ὅθεν καὶ ἡ τύχη τοῦ ἀορίστου εἶναι δοκεῖ καὶ ἄδηλος ἀνθρώπῳ. The substitution of ὁρμήν for προαίρεσιν is interesting, but note that the word προαιρέτως follows a few lines further down.

The extremely terse §3 on Epicurus derives from passages in the *Letter to Menoeceus* or similar expositions in one or more lost works.

C Chapter Heading

Attested in both P and S (but see below), and of the standard umbrella type 'about x', *περὶ τοῦ δεῖναι* (cf. above, ch. 1.3 Commentary C). The series of chapters 1.9–29 (plus 1.30) on the foundational concepts of physics are without exception introduced by headings of the umbrella type. In the present chapter it allows for the question type/category of substance and the question type of cause. It is widely paralleled as a book title. The longer umbrella heading *Περὶ τύχης ἢ αὐτομάτου* as in S (and the parallel embedded headings in the related accounts of ps.Plutarch *Fat.* c. 7, 571E and Calcidius *in Tim.* c. 158), though more accurately reflecting the contents of the chapter, should not be favoured, because *τύχη* and not *τὸ αὐτόματον* is to be understood as the grammatical subject of the first sentences of all four lemmata (in §1 S has to add *τὴν τύχην ἀπεφαίνετο*).

D Analysis

a Context

This is the last chapter of the block of five interrelated chapters dealing with necessity, fate, and chance. Treatment of chance after fate can be paralleled in for instance ps.Plutarch *De fato* and Calcidius *In Timaeum*. In S ch. 1.5 'On fate and the spontaneous' is followed by 1.6 'On chance'. With the chapter *Περὶ τύχης* the presentation of the important theoretical concepts of physics ends for all practical purposes, since ch. 1.30 *Περὶ φύσεως* is an appendix to ch. 1.24, and is also associated with ch. 1.1 *Τί ἐστιν ἡ φύσις*.

b Number–Order of Lemmata

(1) The four doxai in P can all be located in S and three of the four are also cited by T in the same order as in P (the exception is the Epicurean doxa).

(2) S has split up the Aristotle doxa, citing a first part before and a second part after the Plato doxa, which makes the repetition of the name-label Aristotle unavoidable. Diels gives a separate paragraph (his §2 and §3) to each of these, presumably also inspired by the fact that they have been abstracted from successive chapters in Aristotle's *Physics*, see above at section B. Thus, P₁ = S₂ and P₂ = S₁ + S₃. Adapting P's single original paragraph to the arrangement in S, he distributes P's Aristotle doxa over the two paragraphs §2 and §3. S also appears to have added more material to the Aristotelian material, see above at A. We have not followed Diels' rearrangement.

c Rationale–Structure of Chapter

Diaphoniae. The structure is not very clear, and the oppositions are not very pronounced. The doxai are listed on several gliding scales. §1 Plato and §2 Aris-

total are in agreement that chance is an accidental cause, §2 Aristotle and §3 Epicurus that it is unstable, though according to the first in the context of purposeful action, and according to the second under several kinds of circumstances. Again, §2 Aristotle and §4 Anaxagoras Democritus the Stoics are agreed in distinguishing between chance and the spontaneous, while §1 Plato and §3 Epicurus do not mention the latter. Furthermore, §4 Anaxagoras Democritus the Stoics distinguish necessity (cf. chs. 1.25–26) and fate (cf. chs. 1.27–28) on the one hand from chance and the voluntary and the spontaneous on the other; §3 Epicurus distinguishes from each other necessity, the voluntary, and chance; while §1 Plato includes chance in the realm of the voluntary and does not mention necessity (which presumably implies that he is made to distinguish it from chance, but see ch. 1.27.2).

d Further Comments

Individual Points

§1 Diels ad loc. is correct in preferring P's ἐν προαιρετικοῖς to ἐν ἀπροαιρέτοις in S, as the rest of the doxa shows. Diels gives as parallel the discussion at ps.Plutarch *Fat.* c. 7, 571E–572C, which shows that the treatment of chance in Platonist interpretations emphasizes its role in human action (digging in order to plant a tree and fortuitously finding gold). Note that κατὰ συμβεβηκός goes with ἐν προαιρετικοῖς only, but even the term σύμπτωμα appears to refer to human action only. A similar approach is found in the Aristotelian doxa, lines [8–12], where the contrast with τὸ αὐτόματον is made explicit. We note that S (σύμπτωμα, καὶ προαιρέσεως) and T (ξύμπτωμα φύσεως ἢ προαιρέσεως) have preserved words not found in P's lemma; these must go back to A, another instance of the significance of agreement between S and T against P.

Diels ad loc. further argues that T's καὶ πάλιν ξύμπτωμα φύσεως ἢ προαιρέσεως may be correct. But the addition of ἢ προαιρέσεως makes the sentence grammatically awkward, if not impossible. We follow Wachsmuth in placing a comma after σύμπτωμα and taking προαιρέσεως with the final word σχέσιν.

§3 On the second part of the doxa see above section D(b). The combination persons times places is originally rhetorical, see Nem c. 31, p. 31.14–17, quoted section E(b)§3.

§4 Diels ad loc. places the name Anaxagoras in parentheses because he believes that it is not found in the mss. of S. However, as indicated by Wachsmuth ad loc., the Presocratic's name is found in an abbreviated form in the margin of the ms. P and fully written out in the margin of F a little higher on the page.

e Other Evidence

Aristotle discusses chance and the spontaneous at *Phys.* 2.4–6. The substantial accounts of ps.Plutarch, Nemesius and Calcidius have been mentioned above at section B.

Commentary

A *Witnesses*

(1) This chapter is very poorly attested, being found only in P^B and Q, with in §2 of G's ch. 20, with the same title, a terse and generalized abstract (there is no chapter Περὶ φύσεως in Ps). G combined this abstract from the present chapter (his §2) with two others, one from ch. 1.1 (his §3) and another (his §1) from elsewhere. See ch. 1.1 above, Commentary A(4).

(2) It is not entirely to be excluded that the title of S 1.41 Περὶ φύσεως καὶ τῶν συμβαινόντων ἐξ αὐτῆς includes a reference to our present chapter (cf. M–R 3.416), but it does not record any of its contents. The other witnesses may have regarded it as doubling up on the earlier chapters 1.1, 1.17 and 1.24.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* There is no proximate tradition apart from that reflected at ch. 1.24.2, q.v.

(2) *Sources.* The ultimate sources are the works of Anaxagoras and Empedocles, but the combination of the doctrines of these philosophers with the focus on combination and separation of (parts of) elements derives from Aristotle *GC* 1.1 and *Met.* A.3. This is also the case for Theophrastus in *Phys.Op.* frs. 3 and 4 Diels (227A and 228A FHS&G) preserved in Simplicius. Elsewhere too Aristotle provides comparisons of Anaxagoras and Empedocles. This focus on combination and separation is combined with the related treatment of φύσις at *Met.* Δ.4, where Anaxagoras is not explicitly mentioned but the Empedocles fragment is quoted. We note that only a small section of the discussion of *Met.* Δ.4 is reflected in our chapter. Moreover Aristotle's different treatment of the Empedocles fragment has not been taken into account, namely what appears to be his interpretation of φύσις in the sense of οὐσία, 'substance'. The interpretative introduction to the fragment in §1, in other words, does not derive from

Aristotle, but anticipates the views of Plutarch and (if this treatise is to be dated later) ps.Aristotle *MXG*; see at section E(b)§1.

C Chapter Heading

Attested in P (and perhaps S), and of the standard umbrella type ‘about *x*’, *περὶ τοῦ δεῖναι* (cf. above, ch. 1.3 Commentary C). The series of chapters 1.9–29 on the foundational concepts of physics are without exception introduced by headings of the umbrella type and so is 1.30. In the present chapter it allows for existence, the question at issue here. But we should not forget that the quotation of Empedocles is first found in Aristotle’s philosophical lexicon at *Met.* Δ.4, which deals with the various meanings of φύσις. This reference may be more to the point than the parallel with the ubiquitous book title *Περὶ φύσεως*, ‘On nature’, in the sense of ‘On philosophy of nature’, which is attributed to the Presocratics in general and first used by Aristotle himself to refer to his own *Physics*, e.g. *Met.* A.2 983b1, A.4 985a12, A.5 986b31, and A.8 989a24. The parallel titles and headings at section E(b) Chapter heading have been cited below for the sake of completeness.

D Analysis

a Context

The chapter is found in an isolated position at the end of the book, after the set of chs. 1.25–29 dealing with fate and related issues, and at quite a distance from ch. 1.24 to which it can be regarded as a sort of sequel, as it takes up the theme of the compromise doxa of 1.24.2 in different terms. It is an appendix (‘mantissa’, Diels *DG* 57) to ch. 1.1 ‘What is nature’, as it raises a point absent in the earlier chapter. So there is a return to φύσις, although a peculiar one. And it can also be regarded as an appendix to the Book as a whole, for as we leave the chapters on necessity, fate, and chance, the last of the theoretical chapters, and return, at least formally, to nature qua process, a transition is achieved to the next Book, on cosmology. Lachenaud (1993) 239–240 adduces ch. 1.24.2 and gives some information about the discussion in the secondary literature.

b Number–Order of Lemmata

(1) Two doxai are preserved in P, the former including four lines quoted from Empedocles’ poem (also found at Aristotle *Met.* Δ.4 1015a1–3 (slightly abridged), Plutarch *Adv.Col.* 1111F). Though the Atomists are lacking and no doxa that would create a diaphonia is included, the chapter may well be complete. But in the absence of S we have no proof.

(2) The order, first Empedocles and then Anaxagoras—though we learn in *Met.* A.4 984a8–11 and Theophrastus *Phys.Op.* fr. 3 Diels, 227A FHS&G, that

Anaxagoras was earlier—, is determined by the fact that the quotation of the Empedoclean lines is inspired by *Met.* Δ.4 1015a1–3, a chapter that fails to mention Anaxagoras, who was added at a later stage of the tradition. His verbatim fragment has been preserved by the conscientious Simplicius alone.

c Rationale–Structure of Chapter

The not very strong diaphonia, exceptionally and interestingly, is not between the lemmata themselves but between the heading ‘On nature’ and the contents of the lemmata. The heading at the very least suggests a treatment of some aspect of the philosophy of nature in line with what is mentioned in ch. 1.1, ‘What is φύσις’ and with the sort of work that provides an account of the *physikos logos*. But the lemmata reproduce the unanimous denial of the reality of φύσις qua ‘origin’ at §§1–2 by Empedocles and Anaxagoras. Unlike Aristotle at *Met.* Δ, later interpreters preferred to interpret φύσις in Empedocles and Anaxagoras as γένεσις, ‘origin’, in the sense of one element changing into another, or of *genesis ex nihilo*, both of which are of course denied by Anaxagoras and Empedocles.

d Further Comments

Individual Points

§1 In the first line Diels follows Stein in emending the mss. (φύσιν) μηδὲν το (φύσιν) μηδενός on the basis of the poetic quote. This genitive, likely enough in itself, finds further confirmation in the balancing genitive τῶν στοιχείων in the contrasting phrase μίξιν δὲ τῶν στοιχείων καὶ διάστασιν. Mau and Lachenaud follow the mss., though μηδὲν as attribute of φύσιν cannot be paralleled. The English ‘no such thing as nature’ would attempt to translate this bizarre construction. Lachenaud translates as ‘il n’y a en rien naissance’. A’s poetic quote has also been emended, and rightly so, from mss. οὐδὲν, on the basis of the quotation in Aristotle and Plutarch. Nevertheless A (as so often happens) may have written a non-metrical version of the quote and anticipated this in the introductory sentence, and our task is in the first place to find out what A and not what Empedocles wrote, so doubts remain. The differences in meaning between these different readings are unsubstantial.

e Other Evidence

See chs. 1.1 and 1.24.2 above.

4 Whether the Cosmos is Indestructible 794

5 Where the Cosmos Obtains Its Nourishment From 816

5a Where the Cosmos Has Its Regent Part 826

6 From What Kind of First Element the God Began to Make the
Cosmos 833

7 On the Order of the Cosmos 845

8 What the Cause of the Cosmos Having Been Tilted Is 858

9 On What is Outside the Cosmos, Whether There Is a Void 864

10 What the Right Parts of the Cosmos Are and What the Left 876

11 On the Heaven, What Its Substance Is 883

12 On the Division of Heaven, into How Many Circles It Is Divided 896

13 What the Substance of the Heavenly Bodies Is, Both Planets and Fixed
Stars 903

- 14 On the Shapes of the Stars 920
- 15 On the Ordering of the Heavenly Bodies 927
- 16 On the Conveyance and Movement of the Heavenly Bodies 938
- 17 From Where the Heavenly Bodies Obtain Their Illumination 949
- 18 On the Stars Called the Dioscuri 957
- 19 On Signs of the Seasons Produced by the Heavenly Bodies 962
- 20 On the Substance of the Sun 970
- 21 On the Size of the Sun 992
- 22 On the Shape of the Sun 1005
- 23 On the Turnings of the Sun 1012
- 24 On the Eclipse of the Sun 1024
- 25 On the Substance of the Moon 1034
- 26 On the Size of the Moon 1049
- 27 On the Shape of the Moon 1056
- 28 On the Illuminations of the Moon 1065
- 29 On the Eclipse of the Moon 1078
- 30 On Its Appearance and Why It Appears to Be Earthy 1090
- 31 On the Distances of the Moon 1103
- 32 On the Year, How Great the Time of the Revolution of Each of the Planets Is, and What the Great Year Is 1113

BOOK 3 Meteorology and the Earth: Text and Commentary 1129

- Introduction to Book 3 1131
 - Title and Index 1140
 - Prooemium 1144
- 1 On the Circle of the Milky Way 1149
- 2 On Comets and Shooting Stars and Beams 1168
- 3 On Thunders, Lightnings, Thunderbolts, Firewinds and Typhoons 1182
- 4 On Clouds, Mist, Rains, Dew, Snow, Hoar-Frost, Hail 1203
- 5 On the Rainbow 1214
- 5a (Formerly 18) On the Halo 1235
- 6 On Rods 1241
- 7 On Winds 1245
- 8 On Winter and Summer 1254
- 9 On the Earth, and What Its Substance Is and How Many There Are 1259
- 10 On the Shape of the Earth 1265
- 11 On the Location of the Earth 1272
- 12 On the Inclination of the Earth 1280
- 13 Whether the Earth Is at Rest or Moves 1283

- 14 On the Division of the Earth, How Many Zones There Are 1292
- 15 On Earthquakes 1300
- 16 On the Sea, How It Came to Be and How Bitter It Is 1320
- 17 How Low and High Tides Occur 1330

User's Guide to the Edition and Commentary

1 Introduction

The aim of this user's guide is to assist the reader in making use of the present Edition and Commentary on the *Placita*. It is a pared down version of section 6 of the General Introduction. For references to further discussion of details see the notes to the General Introduction in Volume One.

2 The Division into Four Parts

The sequence of the Edition and Commentary is based on the insight that ps.Plutarch's *Epitome* of the original no longer extant work by and large preserves the structure of Aëtius' compendium. Part One contains the necessary preliminaries, including the General Introduction, followed by the Edition and Commentary on Book 1 on the principles of nature. Part Two comprises Book 2 on cosmology and the heavens and Book 3 on meteorology and the earth. Part Three treats Book 4 on the psychology of the human being and Book 5 on the physiology of the human being and other animals. For each of the five books, the edition of its chapters is preceded by a compact introduction giving an overview of its transmission, subject-matter, name-labels of philosophers and schools, method and sources. Part Four presents an English translation of the edited text of all five books, together with the bibliography and the indices.

For all the 135 chapters of the entire work, the Edition and Commentary use an identical method and layout. Only the chapters on the pinakes and the four procœmia to Books 1–4 differ in a few respects. The essential features of this method and layout will now be explained in detail, commencing with the edition.

3 The Edition

Following the conventions of classical scholarship, the edition of the Greek text and all its accompanying apparatus are formulated in Latin. The many abbreviations and sigla that we use are set out at the beginning of Parts One to Three.

For each chapter we begin with a list of the relevant *testes* (witnesses). First in this list are the passages from the *testes primi* (primary witnesses) and the name of the editor of the text edition used. These witnesses are: ps.Plutarch

(abbreviated P) and his tradition, Stobaeus (S) and Theodoret (T). Below them on the next line, passages from the *testes secundi* (secondary witnesses) are listed when available, again including their abbreviation and the name of the editor used. They are always introduced with the capitalised Latin abbreviation Cf. (abbreviation of *confer*, i.e. 'compare' or 'see also').

The text of the chapter then follows. It begins with the *titulus* (chapter heading), followed by the numbered lemmata, each consisting of one or more name-labels (sometimes unspecified) plus a doxa. The lines of the text are continuously numbered, as indicated in the margin, beginning with the chapter heading. Following the heading and each lemma of the chapter the primary sources for its text are indicated by the sigla (P,S,T), or (P,S) when T is lacking, or (S,T) when P is lacking, or (P,T) when S is lacking, or only one of these when only one primary source is available. The numbers after the siglum in each case indicate the number of the doxa in the sequence of the text of the primary witness as indicated in the text used.¹ This system gives the crucial information on the attestation of the lemmata at a single glance.

Beneath the text we first list the references to the collections of fragments of Presocratics, Academics, Peripatetics, Stoics and others where individual lemmata can be located. In the case of the Presocratics we refer only to the sixth edition of Diels-Kranz (abbreviated DK), not to collections of individual authors. Similarly for the Stoics we use where possible Von Arnim's collection (*SVF*). For other authors we use the most recent collections.² In the case of authors whose original writings survive, we refer to passages from which the doxa is derived, whether directly or indirectly.

Next we present the apparatus criticus to the text. Its aim is to give full and detailed insight into all the relevant variants of the primary and secondary witnesses. It is therefore not a *negative* but a *positive* apparatus.³ This is necessary because we are not editing a single text from manuscripts and indirect quotations, but rather are *reconstructing* our text from a multiplicity of witnesses both direct (*primi*) and indirect (*secundi*), each of which has its own relation to the lost original *Placita* as collected by Aëtius.⁴ Some of these, such as the frag-

1 These numbers are not found in the texts of Mau, Wachsmuth and Raeder. They have been supplied by us.

2 Rarely we list two collections when they are both current or complementary, e.g. for Strato (Wehrli, Sharples) and Posidonius (Edelstein-Kidd, Theiler).

3 Contrary to our previous practice in the *specimen reconstructionis* of Book 2 in M–R vol. 2.2; see General Introduction, section 2.8.

4 For detailed accounts of these witnesses and the editions used see General Introduction, section 4.2–4.

ments of ps.Plutarch in the Antinoopolis papyrus, the Arabic version of ps.Plutarch by Qusṭā ibn Lūqā translated into German by Hans Daiber, and the new critical edition of a large part of ps.Galen by Mareike Jas, have become available only quite recently. In addition we pay due attention to a variety of earlier editions and also note significant readings, conjectures and emendations when the texts of individual doxai are included in collections of fragments. In general, it is only in the case of the primary witnesses ps.Plutarch and Stobaeus (but not Theodoret) that we give the variants of the main manuscripts. For other texts we give the preferred reading of the relevant critical edition, only mentioning manuscript variants on rare occasions. The Arabic translation of Qusta is cited in Daiber's German version. Based on these principles, the apparatus criticus not only strives to shed light on our choices, but also to inform the user about the peculiarities of the widespread tradition. Because this apparatus is necessarily often rather extensive, it proved impossible to allocate room for the translation next to the Greek text in a synoptic format without chopping up text, translation, and apparatus and creating a succession of blank spaces. For this reason the translations of the Greek text of all 135 chapters, forming a continuous English version of the treatise as a whole, have been printed in the final part, *Aëtiana* 5.4.

Three more sections of the edition remain. First we print the texts of the *testes primi* (primary witnesses) for the reconstruction. In first place is always Theodoret when he has cited this text, followed—with its own sub-heading—by the *traditio ps.Plutarchi*, i.e. the bevy of representatives of the tradition of the *Epitome* available for the relevant chapter. First when available is the Antinoopolis papyrus. This is followed by the text of ps.Galen, the most important of the witnesses to this tradition. We also include texts from ps.Justin, Cyril, Lydus, Psellus, Symeon Seth and others, all of whom excerpted ps.Plutarch. For reasons of space the texts of ps.Plutarch and Stobaeus themselves (and also Eusebius' verbatim excerpts) are not quoted separately. They can be readily found elsewhere. But it is important to note that our debts to and differences from Diels' *DG* edition of Aëtius and to other editions of the primary witnesses are fully accounted for in the apparatus criticus to the Greek text, and often also further discussed in the Commentary.

Next is a section setting out the *testes secundi* (secondary witnesses) who can also offer some assistance for the reconstruction and analysis of the text.⁵ They represent the doxographical traditions closest to Aëtius. Some of these, namely

5 For detailed accounts of these witnesses and the editions used see above General Introduction, section 4.5.

Athenagoras, Achilles, and Nemesius were included by Diels in his apparatus among the *aliorum ex Aetio excerpta*. Because, unlike in the case of Theodoret, it is not certain that these authors actually did excerpt Aëtius, we have preferred to group them together with other passages in the *Aratea*, Hermias, and Scholia to various authors, regarding them as a collection of writings that are closest to the Aëtian tradition without being part of it. They are closer than the texts that we have placed in the proximate tradition.⁶ It should be noted that the distinction is somewhat fuzzy. Texts very close to Aëtius such as in Varro, Philodemus, Cicero and Philo of Alexandria could have been included. The difference is that these texts antedate Aëtius, whereas the *testes secundi* are all later than he is and so could have used his work, whereas this was impossible for the writers just mentioned.

The final sub-section of the edition is a collection of parallel passages quoted from the reconstructed text of other chapters of Aëtius, which we have given the title *Loci Aetiani*. These passages contain various kinds of similarities: to name-label(s) plus doxa, or to parts of doxai, or to particular formulations of doxai or name-labels. They thus provide detailed information about such uniformities as are present in the *Placita* as a whole. Parallels in chapter headings or in the quaestiones (questions or topics) being treated, are generally placed first, followed by those relating to particular lemmata.

4 The Commentary

The second main section of each chapter contains the Commentary. It too follows a fixed and identical schema of treatment, as indicated by alphabetically numbered sections, some of which are further divided into sub-sections and sometimes even further sub-divided. By consistently using this system of divisions, we aim to organise the mass of material involved with a maximum of clarity. Each of these sections and sub-sections will now be explained in turn.

A: Witnesses. In this section we present the evidence as preserved in the primary and secondary witnesses and discuss issues that it might raise. We generally commence with (1) ps.Plutarch and his tradition, since the *Epitome* mostly preserves the general structure of the work and its lemmata best. Sad to say, in the case of Book 5 this tradition is virtually all that we still have. Thereafter follows an analysis of the evidence as presented in (2) Stobaeus and (3)

⁶ See the explanation of the distinction in the General Introduction, sections 4.1 and 5.1.

Theodoret. In this section we often engage in a first sifting of the evidence for the reconstruction of the chapter, followed by further details in section D(b) below.

B: Proximate tradition and sources. This section gives an overview of the texts that can shed light on the subject and contents of the chapter. The first sub-section (1) discusses the proximate texts, i.e. the doxographical tradition which resembles the *Placita* in its focus on questions of the φυσικὸς λόγος, on philosophers and the answers they gave to those questions. These texts can be earlier than Aëtius and represent the anterior tradition from which he drew his material (though the evidence for the early period is rather thin). They can be contemporaneous with him or much later, even as late as Isidore of Seville and (rarely) authors writing in Arabic. The passages discussed may relate to the chapter as a whole or to individual lemmata within it.

The second sub-section (2) turns the attention to the ultimate sources of the subject-matter of the chapter. For the doxai of some philosophers it is sometimes possible to pin down the exact texts on which the doxai are based, e.g. in the extant works of Plato, Aristotle and Epicurus. More often other comparative material will need to be brought to bear, again from Plato and Aristotle, but also from Hellenistic, early Imperial and late ancient texts. Here too, passages discussed may relate to the chapter as a whole or to individual lemmata within it.

For both sub-sections it is the case that many or even most of the texts discussed will be printed in the third main section Further related texts below, to which we frequently cross-refer. Given the large quantity of texts involved, it is not possible to discuss all this material in great detail, but rather we will draw attention to the salient points to which it gives rise.

C: Chapter heading. In this section we give detailed discussions of the type and significance of the chapter heading, including how it relates to the standard question-types that were developed on the basis of the Aristotelian example and were used throughout antiquity. We note, where applicable, the variant readings for the heading in the witnesses and motivate our choice for the chosen formulation. We also give an overview of parallel headings that are embedded in texts or book titles elsewhere. These too are cited below in the section Further related texts.

D: Analysis. This section, which contains our interpretation of the contents of the chapter, consists of five sub-sections (though not all of these are always required for every chapter).

D(a) context. Here we briefly discuss the place of the particular chapter within the group of chapters of which it is a member and the position of this

group in the context of the Book as a whole. We also note possible analogies with the way other books of the *Placita* are structured and point out particular links that a chapter might have with chapters elsewhere and sometimes also with ancient traditions such as the Peripatos and the Stoa.

D(b) *number–order of lemmata*. In this sub-section we return to the witnesses for the contents of the chapter and determine where possible the number of doxai originally present and the order in which they were listed. For this we depend largely on the evidence of the witnesses themselves, as informed by the understanding that we have gained of their methods, but are sometimes assisted by the secondary witnesses and indeed also by texts in the proximate tradition and beyond. For determining the sequence of the doxai it is also important to understand the argumentative structure of the chapter, often revealed in its diaereses or diaphoniae (see also the following sub-section D(c)). Here we also note how our sequence compares with that established by Diels. Often the result is the same, but there are also many cases where we reach a substantially different result, which of course is fully explained and justified.

D(c) *rationale–structure of chapter*. This sub-section contains the nucleus of our interpretation of a chapter. It is a distinctive feature of the *Placita* that its chapters have an argumentative structure which is determined by the contents and position of the individual lemmata but at the same time (at least to some extent) determines their selection. The task of this section is to elucidate that structure. It may involve a listing of doxai in order of decreasing or increasing similarity according to the method of diaeresis, or it may involve a contrasting of doxai or groups of doxai in order to emphasize the conflict between them. There is much variety among the 135 chapters. It should be emphasized that the examples used above will not apply at all to monolemmatic chapters and not necessarily to other chapters with a plurality of doxai.

D(d) *further comments*. This sub-section is divided into General points, pertaining to the chapter as a whole (if pertinent), and individual points pertaining to individual lemmata. These latter, presented in order of the place of the doxa/doxai in the chapter, may relate to the constitution of the text, and/or may enter into detailed discussions of the interpretation of the philosophical or scientific view portrayed by the contents of the lemma concerned. It will be understood that, in the light of the astonishing breadth of topics and thinkers broached in the *Placita*, we have had to be necessarily selective in making such comments. References are frequently made to the secondary literature, but here too we have needed to be selective.

D(e) *other evidence*. This final sub-section of the Commentary follows on from section B above. It embarks on more substantial discussions of evidence in the wider doxographical or anterior philosophical and scientific traditions,

including some of the secondary witnesses (especially Achilles). These can be either of a textual or of a content-related nature, depending on what is relevant for the interpretation of the chapter and/or some of its individual lemmata.

5 Further Related Texts

Our presentation of each chapter ends with a third and final section entitled E: *Further Related Texts*. It too is further sub-divided into two parts.

E(a) *Proximate tradition*. Here, as the name indicates, we present an extensive collection of texts drawn from the proximate doxographical tradition, as outlined in the General Introduction, section 5.1. We print the texts in the original Greek and Latin (with occasionally some texts translated into German or English, for we have no Arabic). These texts link up with the discussion in the earlier section B(1) of the Commentary. The selection begins with General texts dealing with the subject in question and/or covering the views of a plurality of thinkers. The next section lists, where available, the texts that contain or illustrate the chapter headings or sometimes the quaestio posed by that heading. Thereafter texts are listed under the individual lemmata of the chapter. In order to facilitate the reader's orientation, the name-labels of the relevant lemma are printed in bold italics. For all three listings the texts are most often printed in full and are presented in approximate chronological order.

E(b) *Sources and other parallel texts*. In this sub-section we link up with the discussion in the earlier section B(2) of the Commentary and print a collection of texts relating to the wider tradition of ancient philosophical and scientific tradition, including those texts that shed light on the sources that the doxographers may have used to formulate the doxai collected in the *Placita*. These follow the same basic method as in the previous sub-section. They are usually printed in full in the original Latin and Greek, are divided into the same three groups in an approximately chronological sequence, and are highlighted in the same way. In the case of some texts, either very well-known or somewhat tangential to the matter at hand, we give references only.

For further discussion of the texts collected in section E of the Commentary, including a justification of their extent and the method of citing them in the ancient languages only, see the General Introduction, section 6.5.

Aetius Placita
Book 2 Cosmology:
Text and Commentary

Introduction to Book 2

1 Transmission

Book 2 is the best attested part of A's compendium. P, whose abridged version best preserves the work's original structure, has 32 chapters. It is almost certain that he coalesces two original chapters into a single chapter (2.5 and 2.5a), so there will have been 33 in all. S, using the different method of the anthologist, takes up most of the book in his cosmological chapters 21–27, although he also includes some material in the chapters on first principles (11–20, see A 2.7–8). T in his paraphrasing way uses material from 14 of the chapters (2.1–5, 13–14, 20–22, 26–27, 29, 31), most valuably confirming that there must be a common source behind the three witnesses. However, to our knowledge, he does not in this book bear witness to any doxai not preserved by P or S (with the exception of some stray doxai of which it is not wholly certain that they originally derived from A, see ch. 2.2 Appendix). The reason that this book is so well attested is that S is best preserved for the material of this book and he appears to have been very thorough in his excerpting. Of the 217 doxai in the book,¹ as far as we can tell, he records all but 18 of them (= 91%), of which 5 are Platonic or Aristotelian doxai replaced by excerpts from AD and a further 6 are anonymous doxai that do not fit well into his schemes of coalescence. In contrast P retains 148 doxai (= 69%), while T draws on only 46 (= 21%). At this point we can add the conclusions drawn by Edward Jeremiah on the basis of his statistical analysis of the *Placita*. If all the chapters are taken individually (with the exceptions noted above), since they are all witnessed by both P and S, they would be 'most likely complete' (M–R 4.286, 373). However, if we aim to determine the maximum likelihood size for the work as a whole and the conclusion is reached that there are 'in the order of 42 doxai missing from chapters where we have multiple witnesses' (M–R 4.295), then it is likely that there may be a very small number of doxai that are missing entirely. It may be concluded, therefore, that the book is *as good as complete* and it was for this reason that in a previous volume we chose this book for our *specimen reconstructionis* in order to see whether a single-column edition of A was feasible and justifiable (M–R 2.295–654).

The transmission of P is also excellent for this book. Aside from P^B and Q, which are complete (except one chapter missing through haplography in Q, 2.27), there are many other partial witnesses. The oldest, the Antinoopolis

1 For these statistics see Appendix 3 to the General Introduction in Part One.

papyrus, has only two snippets (2.23, 2.25), but E faithfully copies out 26 of the 32 chapters, while G is generous in his epitomisation, reducing P to 112 doxai which amount to 75 % of the total (though some lemmata are reduced further). Evidence is also supplied by Cyril (chs. 1–4), Lydus (chs. 25, 28, 31) and a group of other witnesses (chs. 11, 12, 22, 24, 31). Finally, Psellus and Symeon Seth utilise the majority of the book's chapter headings (23 and 22 respectively), but almost none of the contents of the doxai.

The secondary witnesses—'cousin writings' that share the same narrower doxographical tradition—also provide valuable evidence. Chs. 4–23 of the manual of Ach cover exactly the same ground as Book 2 and provide comparative material for no less than 22 chapters. The doxai it contains are particularly valuable for chapters on the substance, shape and size of the various cosmic bodies, but also for other topics. On Achilles and the *Placita* see further M–R 2.126–134. The various Aratean prolegomena and scholia also contribute material, including an important diaphonia on the substance of the sun (ch. 2.20).

2 Subject Matter and Macrostructure

The subject matter of the book is indicated prospectively in its Preface (ch. 2.proœm.) and retrospectively in the Preface to Book 3 (ch. 3.proœm.). Moving from the principles and the elements (i.e. Book 1), it turns to the 'products' (ἀποτελέσματα), beginning with the most comprehensive, i.e. the cosmos. Looking back (ch. 3.proœm.), the compiler refers to the book as 'the account of the things in the heavens' (ὁ περὶ τῶν οὐρανίων λόγος). The book thus focuses on cosmology as it relates to the cosmos as a whole and to its heavenly realm. In most Greek philosophical systems there is a strong connection between cosmology and cosmogony (and sometimes also cosmophthory), but there is surprisingly little evidence of this in our book. Cosmogony predominates in chs. 1.4, 2.4 and 2.6, but occurs elsewhere in this book only in order to explain the origin of certain cosmological phenomena (e.g. ch. 2.8 on how the cosmos came to be tilted).

The structure of the book's subject matter treated in its 33 chapters is straightforward and clear. Its contents are divided into five clusters of subjects, with a final chapter connecting some of the clusters at the end. The first cluster focuses on the cosmos as a totality (chs. 1–10), the second and briefest on the heaven (chs. 11–12), the remainder on parts of the heaven (chs. 13–19 on the heavenly bodies, chs. 20–24 on the sun, 25–31 on the moon) and a final chapter (ch. 32) on the lengths of time of the heavenly bodies' movements.

This sequence moves from the whole to the parts, and from the outside of the cosmos to the inside, a process that is germane to the work as a whole (see M–R 2.1.40–41, 50–59 and *passim*), and will be continued in Book 3 (see its Introductory remarks).

The clusters follow a recurrent pattern in the way they treat their subjects which is adapted to suit the particular features of each. The treatment involves answering topics relating to the question types of substance (chs. 1, 3, 11, 13, 20, 25) and of quality (chs. 2, 4, 14, 22, 27), and then further in the categories of quantity (chs. 1, 12, 21, 26, 31, 32), of relative position (chs. 7, 15, cf. 10), of place (ch. 9) and—relating to all the categories—on motion (chs. 16, 23, perhaps also a missing chapter on the cosmos, see the appendix to ch. 2). In addition, there are question-types on cause or origin (chs. 4, 6, 8, cf. 5, 17, 23, 28, 30), as well as a number of chapters linked to individual aspects of the subjects treated, such as the Dioscuri (ch. 18), heavenly signs (ch. 19) and eclipses (chs. 24, 29).

The subjects treated are generally well indicated in the chapter headings. The vast majority of these follow the umbrella type Περὶ x (25 out of 33), which sometimes explicitly indicates the category involved (e.g. οὐσία, μέγεθος, σχῆμα, τάξις, κίνησις), but also can conceal it (e.g. περὶ τροπῶν, περὶ τοῦ ἑκτός). But other formulas are also used involving interrogatives (τίς, πόθεν), conjunctions (εἰ) and other prepositions (ἀπό), all of which follow the familiar patterns of the *Placita*.

3 Name-Labels

The vast majority of the name-labels, which are an intrinsic component of every doxa, refer to philosophers in the ancient sense of the term, in this context philosophers engaged in physics or natural philosophy. A number of other thinkers and writers are mentioned—scientists (Aristarchus ch. 2.24, Eratosthenes 2.31, Eudoxus 2.19, Seleucus 2.1), a scholar (Apollodorus of Athens ch. 2.16), a geographer (Seleucus ch. 2.1), a poet (Aratus ch. 2.19)—but their number is very restricted. No doctors are included (Alcmaeon is clearly regarded as a natural philosopher for the purposes of this book). Book 2 also has a number of interesting indefinite group names (the physicists ch. 2.6, the astronomers chs. 2.15, 2.16, 2.29, 2.31). There are also more wholly anonymous name-labels than in any other book (15 out of 37; see the listing at M–R 4.359).

In Book 2 the name-labels extend from Thales in the sixth century to the late Hellenistic Stoic Posidonius who is the most recent philosopher to be referred to (died ca. 50 BCE). An impressive range of 53 thinkers and groups are considered to have had opinions worth recording on cosmological subjects (see

Jeremiah's table at M–R 4.307 and listing at 4.354–361). The philosophers most often cited are the *χορυφαῖοι* of the classical age, Plato and Aristotle, both with 18 doxai, together with the Presocratic Empedocles (also 18), closely followed by the Stoics (17 doxai, but 30 in total if we add all the individuals). For the top 15 philosophers see the table at M–R 4.327. However, a closer examination of the name-labels will show that there is a predominance of names from the early Presocratic period of Greek philosophy. This is a feature of the entire work, with the exception of Book 1, as can be seen in the graph at M–R 4.324. But it is especially pronounced in Book 2. The reason is hardly surprising: not only is the history of the earliest period of Greek philosophy dominated by natural philosophy, but there was also a strong diversity of opinions on cosmological subjects, a matter of considerable interest to our doxographer, who throughout Book 2 shows a marked penchant for unusual views. Interestingly, however, Jeremiah has shown that this book shows less diversity of name-labels in relation to its doxai than the others, for which he gives the credible explanation that the standard cosmological model developed in the fourth century superseded the variety of views explored by the Presocratics in the preceding centuries (M–R 4.309).

A feature of Book 2 that strikes the eye is the prevalence of multiple name-labels. In actual fact, when all such name-labels are taken into account, it does not have proportionately more than other books, as shown in the table at M–R 4.329 (about 19% of the whole). But it has a disproportionate number of long strings of name-labels. Thus the very first doxa on the unicity or plurality of the cosmos illustrates the main diaphonia with strings of 11 and 9 name-labels respectively (2.1.2–3). Of the 14 doxai in the work with four name-labels or more, 7 are found in Book 2 (also 2.3.2, 2.4.7, 2.11.4, 2.28.6, 2.29.7). There are also 8 cases of triple name-labels, which too is more than elsewhere (13). On the other hand, we also find in Book 2 the practice of using representative name-labels, particularly in the case of the Stoics, who in chs. 2.2, 14, 22, 26–27 are selected to represent views on the size and shape of heavenly bodies that were generally accepted in Greek philosophy from Plato and Aristotle onwards. These features of the use of name-labels have to do with the method used by the doxographer.

4 Method and Micro-structure

The individual chapters of the book range from three very long chapters on the substance of the three main heavenly bodies (2.13 stars: 16 doxai; 2.20 sun: 15 doxai; 2.25 moon: 15 doxai) to a number of chapters with two lemmata only (2.8,

2.10, 2.12). The majority of chapter are between 4 and 8 lemmata in length, and there are no monolemmatic chapters. The basic order of the lemmata within chapters is seldom in dispute, with those doxai retained by P usually a sound guide. The fullest material, however, is found in S and his particular methods of anthologising sometimes make it difficult to be wholly certain of A's original order (e.g. in chs. 2.4, 2.20, 2.25). But in the case of five chapters we are fortunate that S appears to simply write out a stretch of A's original text (chs. 2.28–32). See further the discussion on his methods in the General Introduction, section 2.4.

Speaking in general terms, the contents of all the chapters in Book 2 are systematically structured. This is achieved by the consistent use of the characteristic dialectical method of the *Placita*, involving extensive use of the techniques of diaphonia (two opposed views) and diaeresis (two views with often a compromise view in between, or an organised list of differing views). These basic structural schemes, which underlie the ordering of the lemmata, are analysed and set out in section D(c) of our Commentary on each chapter. On these strategies of presentation see further M–R 2.3–10. They are present in virtually every chapter, often intelligently and flexibly applied, though it is true that some chapters are less systematic and their rationale is not so easily discernible (e.g. chs. 2.24, 2.30). (In contrast to the analyses in our previous reconstruction of this book in M–R vol. 2 part 2, we have not tried to illustrate them with schematic diagrams, which may have had the danger of making the structures appear too rigid and sometimes a little forced.)

But it would be wrong to conclude that the systematic nature of the presentation of doxai leaves no room for historiographical considerations. Our author has already made it quite clear in Book 1 that he is sensitive to chronology and to the importance of the key successions and sects of philosophers. At the outset of the book (ch. 2.1), he introduces Pythagoras as the one who first used the term *κόσμος* for that which contains all things, followed by two long lists of philosophers espousing the view of a single cosmos and multiple kosmoi respectively, the one starting with Thales and Pythagoras, archegetes of the Ionian and Italian successions respectively, opposed to another list commencing with Thales' pupil Anaximander and containing a bevy of Eleatics and atomists. It is also no coincidence that the two lists end with the four founders of the Hellenistic schools (with the addition of Epicurus' teacher Metrodorus). On 19 occasions, as can be seen at M–R 2.95, chapters display foundational name-labels (from the historical point of view) in their first lemmata. Moreover, key early figures are frequently associated with key doxai in the systematic structures mentioned above. In all three elaborate diaereses on the substance of the stars, sun and the moon, Thales represents the main view that they are 'earthy' (2.13.1, 2.20.9, 2.25.9). Examples could be multiplied. There

is indubitably a tension between the two approaches, systematic and historical. An important result of Jeremiah's research is that, when all five books are compared, Book 2 is the most dialectical and the least historical in its ordering of the doxai. See his analyses at M–R 4.310–319.

Not only does Book 2 have the most chapters (33) and lemmata (217) of any of the books. It is also marked by the brevity of many of its doxai, some of which are so short that they have single word predicates (e.g. A 2.2.2–3, 2.20.9, 2.25.9, 2.27.3–6). On average its doxai are the shortest of any of the five books (16.9 words, compared to the overall average of 25.8). There are only two long descriptive doxai in the book, both on the ordering of the cosmos, attributed to Parmenides (2.7.1) and Philolaus (2.7.6) respectively (cf. also 2.20.12–13). These two important passages give rise to many textual and interpretative problems.

Contributing to the brevity of the doxai in Book 2 is a further feature of the *Placita* method. The compiler makes consistent and heavy use of ellipsis at the beginning of the lemmata, i.e. the suppression of verbs of saying or thinking, often together with the subject and the question being asked (which is assumed from the chapter heading). This practice poses difficulties for the reconstruction of the text, for quite often our witnesses (esp. S) reinsert such verbs and subjects in their excerpts. Research has shown that the first two books are most elliptical, but that Book 2 comes out on top in this regard. No less than 196 of the 214 labelled lemmata have initial elliptical predicates, i.e. 92%. See further Jeremiah's analyses at M–R 4.319–323. For a further conclusion that might be drawn from these analyses, see the next section below *ad finem*.

5 Sources: Proximate Tradition

There is a surfeit of evidence to show that the doxai which A has collected in this book stand for the most part in a long doxographical tradition which we have labelled 'proximate'. Perhaps the most valuable witness to this tradition for Book 2 is a number of passages in Philo *De somniis* (and also the previous treatise *De mutatione nominum*). Though containing no name-labels, when describing the heavens they use many of the same diaereses and doxai that appear in A (esp. chs. 2.11, 2.13, 2.15, 2.21, 2.28). In preparing for the writing of these treatises Philo must have had at his disposal a doxographical handbook very similar to that of A. At least seven other authors reveal similar doxai on cosmological themes, also containing many of the name-labels that are common in Book 2: aside from Achilles and Arius Didymus, there are the brief doxographies on the Presocratics in Hippolytus *Refutatio* and ps.Plutarch *Stromateis*, important parallels in Cicero *Lucullus* and *De natura deorum*,

copious doxographical material in Diogenes Laertius, and some valuable evidence found in authors that have made use of source material from Varro (chs. 2.4, 2.32). In some cases the questions and the diaereses have been preserved, in others the doxai have been wrenched, it would appear, from their doxographical contexts and reassembled in order to make author-based rather than topic-based compilations. A striking example of how close this narrow proximate tradition can be is found in doxai on the substance of the moon. Both Diogenes Laertius and Hippolytus attribute to Anaxagoras the view that the moon has an irregular surface, on each occasion using the same uncommon word *φάραγγες* (ravines) as A does in 2.25.10 (cf. also 2.30.3 *ταπεινά*). Moreover, Cicero *Luc.* 123 attributes lunar plains and mountains to Xenophanes, again in the same terms as we find in A. In Philo *Somn.* 1.22 there is talk of *ἄγχεα καὶ νάπας* (dells and vales) on the heavenly bodies, exactly the same words used of Democritus' view in 2.30.4. It can hardly be doubted that these views all go back to a very specific common tradition.

Other, mostly later authors also offer many further parallels to the doxai in this book, notably Plutarch (esp. in his work *De facie*), Sextus Empiricus, Censorinus, Macrobius and the Patristic authors Tertullian, Basil, Isidore of Pelusium, Augustine and Isidore of Seville. It shows that they utilise the same traditions, though not always at first hand. Of special interest are the texts in Galen and Seneca, showing how the *quaestiones* and diaeretic schemata fundamental to the *Placita* were widely known and utilised (see on chs. 2.1, 2.4, 2.13, 2.15). Further information on the background to A's use of *quaestiones* or *θέσεις* is provided by texts in the rhetors Hermagoras, Theon, Quintilian and Marius Victorinus (see on chs. 2.1, 2.3, 2.4, 2.21, 2.27). These texts show that certain cosmological topics were not just of scientific interest, but had a wider dissemination, if only as illustrations.

A special case is formed by the philosopher Epicurus (341–271), founder of one of the main Hellenistic schools of thought. Epicurus' views are quite well represented in Book 2, with ten doxai to his credit. But what is particularly interesting in the present context is that he demonstrably has used collections of *placita* to illustrate possible views on questions that he regards as beyond scientific certainty. On five topics—the turnings of the sun (ch. 2.23), the eclipses of the sun and moon (chs. 2.24, 2.29), the illumination of the moon (ch. 2.28) and the face of the moon (ch. 2.30) he includes among his explanations doxai that are the same as or similar to what we find in A. Further convergences occur in his treatment of meteorological subjects set out in Book 3. In a detailed analysis (M–R 4.406–413) we have concluded (p. 413) that 'Epicurus in drawing up his treatment of cosmology, and in particular his listings of multiple explanations, made use of doxographical material that was taken up into the tradition

of the *Placita* and three centuries later had found its way into the distillation of this tradition in Aëtius' compendium'. His pupil Lucretius in the first cent. BCE continues the practice of using doxographical material, which leads to deviations from the narrow example of the master (M–R 4.399).

What, then, can be said about the nature and origin of this anterior proximate tradition as evidenced by the contents of Book 2? There is a uniformity of method and content which encouraged Diels, though unaware of the Philonic texts, to postulate a work called the *Vetusta placita* to be dated to the early first century BCE which organised material going back to Theophrastus and the Peripatos. But the evidence for this kind of work goes back earlier, at least to the time of Chrysippus; see M–R 3.125–157. It is more likely that there were a plurality of doxographical works in circulation by A's time (M–R 2.35). Two significant clues are found in Book 2 through rare references to the sources of A's information. Both refer to Theophrastus, in the former case (2.20.4, Xenophanes on the sun's οὐσία) to what he wrote ἐν τοῖς Φυσικοῖς, in the latter case (2.29.8, Anaxagoras on lunar eclipses) without specific reference to a work. But we cannot even be sure which work is being referred to here. It is also possible, based on the contents of ch. 2.31, to consider Eudemus' account of astronomical researches as a source for some of A's material (cf. M–R 3.473). Jeremiah on the basis of his analyses of style and method concludes that in comparison with other books Book 2 has features—more diaereses, less historical ordering—which make it likely that 'its contents underwent a greater degree of reorganisation and compression in the course of its transmission' (M–R 4.316). We can be certain that much of the often bizarre cosmological material from early Greek philosophy found in Book 2 has been sluiced through the researches of Peripatos, and that the method of dealing with this material owes much to methods developed by Aristotle and his successors. But precise details on how these processes took place are simply not available. On the question of A's sources see further the General Introduction, section 5.

6 Other Source Material

For the Presocratic lemmata, which form the bulk of the book's material, we do not have access to any of the original texts. This includes the case for the poems of Parmenides and Empedocles, of which we have reasonably extensive remains—a clear indication that their doxai have been well worked over by intermediate sources (an exception is the reference to the δαίμων at 2.7.1 drawn from fr. 28B12 DK). The first philosopher for whom we can examine the original source is Plato. Given the book's cosmological contents, the chief

source for his 18 doxai would be expected to be the *Timaeus*. But the doxai are clearly not taken from it directly. In almost all cases they have passed through an early Middle Platonist or Neopythagorean filter prevalent throughout the entire work (cf. M–R 2.51). This is most obvious in ch. 2.6, starting with its title ‘From what kind of first element did the god make the cosmos’ which hints at the Platonic demiurge, then using the non-Platonic term νοητὸς κόσμος in relation to the model, and ending with a comment that for the elemental shapes Plato is ‘Pythagorising’. Plato’s association with Pythagoras (also in 2.10.1, 2.23.8) is also a Middle Platonist trait. But also in most other Platonic doxai modifications and additions to the *Timaeus* are made, and in some cases there is no precedent for the view at all, e.g. on the five regions of the cosmos in 2.7.4 and the lunar eclipse in 2.29.7. Exceptionally a Stoic filter is visible in 2.5a.1, where the cosmological use of the term ἡγεμονικόν is neither Platonic nor Platonist (unless this expression had entered into the philosophical *koine* by A’s time). Middle Platonist handbook writers such as Alcinous and Apuleius offer insight into these adaptations, but by the time of the commentator Proclus in the fifth century the amount that we can learn about the doxographical tradition is restricted.

Aristotle plays a significant role in Book 2, though less than in Books 3–5. The structure of his cosmology in *De caelo* exerts a general influence in chs. 1–17 (as does the *Timaeus*), but there is an important difference in that the Stagirite hardly pays any attention to the sun and the moon, in contrast to A who devotes 12 of his 33 chapters to them. Although the number of doxai attributed to Aristotle is large, they are almost all very short (only 2.3.4 is a little longer) and rather uninformative. There is some evidence of the use of works that are no longer extant (e.g. 2.5.1 on the cosmos’ (lack of) nourishment) or of later interpretations (e.g. 2.3.4 on restricted providence). But for some doxai there is no evidence at all (e.g. 2.26.3, 2.28.2, both on the moon). Later commentators such as Alexander and Simplicius offer many general parallels, but do not appear to make use of the *Placita* tradition themselves. In an important text in his commentary on the *Posterior Analytics* John Philoponus shows how the kinds of questions asked in the *Placita* relate to the categories (see on chs. 2.1–4, 2.9, 2.11), but he too does not make direct use of the doxographical tradition.

For Epicurus we are fortunate to have more original writings, both complete and fragmentary, than for any other Hellenistic philosopher and the first two of his extant letters in Diogenes Laertius have substantial sections on cosmogony and cosmology. Summaries of doctrine such as these letters were attractive for doxographers when formulating their doxai. In one case, A 2.7.3 on the boundaries of kosmoi, it is possible that A has drawn directly on the *Letter to Pythocles* (M–R 4.395); in another case there is a strong convergence with a

scholion preserved by Diogenes (2.2.5). In three doxai A includes the key model term ἐνδέχασθαι, which will certainly have been derived from Epicurus himself, either directly or indirectly (2.2.5, 2.13.15, 2.22.4, cf. 2.4.13). In other cases the doxai are closer to texts in later sources, notably Lucretius and Diogenes of Oenoanda (see 2.20.14 on the sun, M–R 4.398). There will be some filtering here that occurred via either scholastic or doxographical traditions in the Hellenistic period, about which we do not know a great deal (Philodemus is as good as silent on cosmology except in his doxography on theology, on which see ch. 1.7).

The Stoa is the youngest school to be explicitly included in the *Placita* and it is heavily represented in Book 2. The subject-matter of the book is identified as part of the Stoic φυσικὸς λόγος as set out in the Stoic doxography at Diogenes Laertius *V.P.* 7.132–133. As already noted, there are no less than 17 doxai with the school name-label, as well as five members mentioned by name (Zeno 2×, Cleanthes 7×, Diogenes 1×, Boethus 1×, Posidonius 2×, but not Chrysippus). These 30 doxai are uniformly very brief. The impression gained, also when comparing them with the extensive doxography in Diogenes Laertius, is that their contents are derived from earlier doxographies rather from original writings, but we have no way of checking. Later evidence on Stoic cosmological views, such as we find in Cicero, Seneca and Cleomedes, offers useful parallels, but is generally more discursive and presents the arguments that are missing in A. It would be gratifying to have access to source material which would allow us to explain how such odd views have been attributed to Cleanthes in A 2.14.2 and 2.27.4.

Commentary

A *Witnesses*

As discussed in the equivalent chapter of Book 1, for the title of the entire work and its individual books we must rely on the evidence of T, the only witness to cite the title of the original work and give the name of its author. The titles in P and those witnesses dependent on its tradition are expanded versions of the original title. For the title at the head of P's Book 2 only the evidence in P^B is available, supplemented by a reference to the book's title in Cyril's extracts from it. Q does not appear to have translated the title, but only indicated the number of the book and its author. On these titles see further Book 1.titulus et index Commentary C.

For the index of chapters P^B is the chief witness, though not all mss. contain it. One of the mss. of Q, Zāhirīya (Damascenus) 4871 contains a translation of the list and thus provides valuable additional evidence on the manuscript tradition. Daiber did not include it in his edition, but he has kindly provided the editors with a translation (see Appendix in vol. 4). On this translation and its source see further the Book 1.titulus et index Commentary A.

Eusebius provides us with two pieces of evidence. The chapters that he writes out from P Book 2 are all in Book 15 of his *Praeparatio Evangelica*. This book, following his usual practice, has itself a pinax which contains the headings of all the chapters he quotes. In addition, he gives a summary of some of the chapters he is going to quote at 15.32.8–10, including most of the chapter headings of chs. 2.1–11. It cannot be considered certain that this represents the pinax of his copy of P, since he might also have based it on the chapters he had written out. But there is likely to have been very little difference. Similarly Symeon Seth in his Preface gives a summary of the headings of many of the chapters in his compendium. This takes the place, as it were, of a pinax. Texts above under *testes primi*.

C *Book Title*

As emphasised in our discussion in Book 1.titulus et index Commentary A, the title for the entire work and each of its books must be based on the evidence of T. The titles in the tradition of P are secondary. P's title in the ms. Mosquensis for Book 2 is very full and uniquely speaks of ἐπιτομή in the genitive, i.e. as if it was part of the title in the nominative (Books 3 and 5 have ἐν ἐπιτομῇ, which must qualify τῶν ἀρεσκόντων). On how this title relates to the title of the original work see Book 1.titulus et index Commentary C.

D *Analysis of the Index*

(1) For a discussion giving the reasons why we are convinced that A's original compendium contained these indices at the beginning of each book, see M-R 2.196–204 and Book 1.titulus et index Commentary D(6) and D(e).

(2) For the methodology of the reconstruction of the index see Book 1.titulus et index Commentary D(3). We argue that priority must be given to the chapter headings in the text of the chapters themselves, since A will have based his index on these when he compiled the work. It is thus to be assumed that the list of chapter headings in the index accurately reflects the chapter headings in the text of the Book. In the index of this book the discrepancies between the pinax and the headings transmitted in within the book itself is greater than elsewhere, there being no less than five chapters where they diverge: chs. 2.5a (not in P), 2.6, 2.13, 2.19, 2.30. In the remaining cases the intra-textual chapter heading has differing degrees of support in the Index list in the manuscripts. The reader is advised to study the apparatus criticus both to the above list and to the headings of individual chapters.

(3) For discussion of chapter headings in P^B, who often opts for the longer variants, see the comments in our Commentary on individual chapters below (section C). It is interesting to note that in the case of eight chapters (9, 11, 12, 13, 16, 19, 20, 32) Q records a shorter chapter title compared with what is found in P^B. He has also conflated the titles of chs. 27 and 28, caused by the omission of the contents of ch. 27 (but not its title) in the main body of the book. This may suggest that he derived his list from the contents of the book rather than translating the index in the ms. he was translating (which would make it less valuable from the textual point of view), but this cannot be considered certain. After all, the mistake may have been in the text on which he based his translation (and so also in its pinax).

D(e) *Other Evidence*

For further discussion on the use of pinakes (tables of contents) in ancient works see Book 1.titulus et index Commentary D(e).

E *Further Related Texts*

For an extensive list of parallel texts relating to the compilation and use of pinakes (tables of contents) or indices of chapter headings, see Book 1.titulus et index Commentary E.

Commentary

A *Witnesses*

The brief introductory authorial statement preceding the chapters of Book 2 is only found in P^B and the translation of the closely related P^Q. This is also the case for the similar comments at the beginning of Books 1, 3, 4 and at 3.8.2.

B *Proximate Tradition and Sources*

The distinction between principles and effects goes back at least as far as Plato's *Timaeus* (cf. 27a, 27d–29d, 47e), without using the same terminology as our text (cf. also the summary of early Pythagorean accounts of the derivation of the cosmos from higher principles at D.L. 8.25). Aristotle also clearly distinguishes between the two in his opening remarks in the *De caelo* and the *Meteorology* (texts below section E(a)). Here too there are no verbal similarities with A. The Stoic distinction between an eidetic and a generic list of topics in the φυσικὸς λόγος at D.L. 7.132 also shows some resemblances to the difference in contents between Books 1 and 2.

Evidence for the specific distinction between principle/cause/element and resultant product first appears in Philo of Alexandria and Plutarch (texts below section E(a)). It occurs a number of times in G in the first part of the work

not derived from A, where it is related to the thought of Plato and Aristotle. In the Middle Platonist tradition the transition from principles to the genesis of the cosmos occurs very clearly in paraphrases or summaries of the *Timaeus* at Tim.Locr. 7 and Alcinous *Did.* 8 (texts below), but the term ἀποτέλεσμα is not used. It would appear that the movement from principles to effects has a Platonic background, but that the terminology used is likely to have been derived from the Stoa.

C Chapter Heading

The introductory remarks have no title but are placed under the general title of the Book, as is the case for the other four passages noted above.

D Analysis

a Context and Rationale

The sentence effectuates the transition from Book 1 on the *principia* to the remaining books on the *realia* of the cosmos and its contents. Further transitions are made at the beginning of Book 3, at 3.8.2 and at the beginning of Book 4. Although these passages are only found in P, it can be considered virtually certain that they were originally present in its source, A. The words περὶ ἀρχῶν καὶ στοιχείων recall the prefatory chapter 1.2, Τὶνι διαφέρει ἀρχή καὶ στοιχεῖα, most of which is taken up by S in his chapter 1.10 entitled Περί ἀρχῶν καὶ στοιχείων τοῦ παντός. On the authorial comments in A see further M–R 2.43–59, on this passage 2.52.

In chapter 1.2 which has as its purpose the distinguishing marks between principles and elements, ἀποτελέσματα are distinguished from ἀρχαί (A 1.2.2), but no explanation is given of how this is the case.

b Further Comments

General Points:

(1) As noted in M–R 2.52, συνεδρευόντων can also be translated ‘what belongs to the same company as,’ ‘is attendant upon’. It implies a group of topics subordinate, or at least consequent upon the principles and elements, i.e. the topics treated in chs. 1.11 to 1.29.

(2) In the phrase πρὸς τὸν ἐπὶ τῶν ἀποτελεσμάτων Diels replaces ἐπὶ with πρὸς, taking over the emendation of the corrector of the Leiden ms. Vossianus Q 2 (a copy in the Planudean tradition, i.e. family III), but this move is unnecessary and has been rejected by subsequent editors. ἐπὶ here literally means ‘in the case of’; cf. Smyth (1956) §1689c. Its use is prompted by the wish to vary the expression used in the previous clause.

Commentary

A Witnesses

For the opening chapter of Book 2 all three major witnesses provide evidence.

(1) P is well-attested, with four witnesses, P^B, C, G and Q. E does not include this chapter or the next because has an agenda of his own that he announces at *PE* 15.22.68. He first highlights the views on those parts of the cosmos regarded by the ancients as ‘visible gods’ before moving on to more religiously neutral cosmological subjects. Thus P chs. 2.20–22, 25–28 and 13–14 are cited first, followed by chs. 1.4–5 and 2.3–11. In this scheme the first two chapters of book 2

(and the preceding prefatory remark) are regarded as superfluous. E's absence is compensated for by Cyril, who quotes the entire chapter verbatim. P^{BCQ} retain seven lemmata, but G drops two of these (§5 Seleucus, §6 Diogenes). The early witness Athenagoras refers only to the title, which he may have derived from either A or P (or indeed elsewhere).

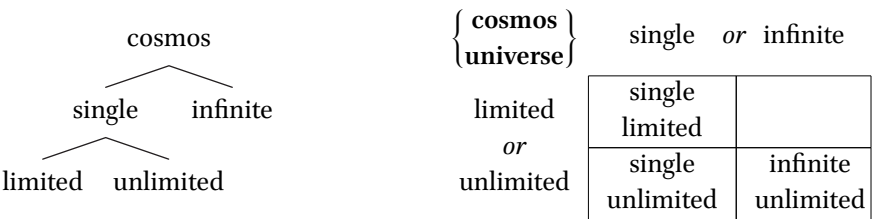

(2) All seven of P's lemmata can be located in S, spread out over two chapters. His procedure here is somewhat curious. In S 1.21, which combines material from A 2.1–6, he first writes out the final four lemmata in P (3ab), followed later by the first lemma in a cluster of material relating to Pythagoras (6c). In the following chapter S 1.22, after writing out A 2.7 (which gives the chapter its title), he recalls that there was a chapter in Book 1 which is relevant to the theme of the cosmos, namely A 1.5 Εἰ ἔν τὸ πᾶν. It is only after he has written out this chapter (without the lemma on Plato) that he returns to P's second and third lemma, which he supplies in a much fuller form with no less than 11 and 8 name-labels respectively (3b). Thereafter he adds (3c) two more lemmata not in P which, given the subject matter, must belong to the present chapter (although presented as one sentence we prefer to divide it up into two separate lemmata, each with a name-label, because of the clear antithesis involved). In sequence the lemmata are thus: S1 at S 1.21.3a, Empedocles (= P4); S2 at 1.21.3a2, Seleucus (= P5); S3 at 1.21.3a3, Diogenes (= P6); S4 at 1.21.3b1, Stoics (= P7); S5 at 1.21.6c2, Pythagoras (= P1); S6 at 1.22.3b1, Thales etc. (= P2); S7 at 1.22.3b2, Anaximander etc. (≈ P3); S8 at 1.22.3c1, infinitists–Anaximander (not in P); S9 at 1.22.3c2, Epicurus (not in P).

(3) T records only the main antithesis in P2–3 = S 1.22.3b1–2. The information he gives, with the copious supply of name-labels for both lemmata, stands much closer to S and confirms that P has drastically shortened his source in these two lemmata. It confirms that the source used by P and S and by T and S was the same document; see Mansfeld (2018a) 185–186. However, the earlier remark at T 4.8 about Melissus, namely that he holds that the cosmos is ἄπειρος, contradicts the statement in §8 and is most likely drawn from another tradition; see M–R 1.274 and above, ch. 1.3 Commentary D(b).

B Proximate Tradition and Sources

(1) *Proximate tradition.* Numerous texts in both rhetorical and philosophical authors reveal that this chapter focuses on one of most popular dialectical *quaestiones* in the φυσικὸς λόγος. See the lengthy list of texts cited below in section E(a). The most instructive texts are those in Philo (*Abr.* 162), Lucian (*Icar.* 8) and Galen (*Loc.Aff.* 3.5 8.159.5–6 Kühn, *HVA* 1.12), which show that A in this chapter is in fact combining two related but separate θέσεις, (a) whether there is a single cosmos or there are infinite kosmoi, and (b) whether the universe

encompassing the whole of physical reality is limited or infinite. The dialectical possibilities of the interaction of these two questions can be shown in at least two ways:

The left diagram shows the diaeretic structure that is used in the chapter; the right diagram with its grid shows how one of the theoretical possibilities (infinite kosmoi and limited universe) is not represented since it does not make sense. A further complication is the link to the question of the void, introduced in §§3 and 9, which can coexist with both a single cosmos and an infinite universe. This theme is also treated in chs. 1.18 and 2.9. Against this background the material on these questions preserved in the proximate tradition is extremely rich, with many of the doxai in this chapter (esp. in §§1–3) paralleled elsewhere.

(2) *Sources.* The question of whether there is a single cosmos or infinite kosmoi is first explicitly stated in Plato’s *Timaeus* and further developed in Aristotle’s *Physics* and *De caelo*. But it is implicit in much Presocratic cosmology and can also be connected with the questions of unity and plurality (see the texts of Gorgias and Xenophon cited below in section E(b)) and also the more general question of whether the cosmos is the result of intelligent design or simply part of a larger universe that is subject to physical necessity; see the studies of Furley (1987), Graham (2006), and Sedley (2007). By the Hellenistic period the opposition between the closed cosmos and the open universe, represented by Plato–Aristotle–Stoa on the one side and atomists–Epicurus on the other becomes quite standard and is found in numerous doxographical summaries. It is then projected back to earlier Presocratic authors such as the Milesians and Pythagoreans (see below section D(d)§4).

It should be noted that the systematic connections between the questions treated in this chapter were already convincingly set out by Aristotle in *Cael.* 1.8–9, to which in the following chapter he adds the question of the destructibility or indestructibility of the single cosmos. In a note at the end of 1.10 (280a23–28) he adds that the answer would change if (successive) infinite kosmoi were admitted, a position against which he has already argued in preceding chapters.

This possibility is not taken into account in the present chapter. He does not refer to any predecessors by name in the discussions on unicity and infinity in 1.8–9. It is only when he starts to discuss the question of destructibility at 1.10 279b12 that names are mentioned. In the later tradition the questions of unicity/infinity and destructibility/indestructibility are often linked and names added. See the detailed doxographies of Philo and Alexander of Aphrodisias discussed in our analysis of ch. 2.4.

C Chapter Heading

The chapter heading is of the most common umbrella type *Περὶ x*, already used in the earlier tradition by philosophers such as the Stoics Chrysippus and Posidonius (but not by Zeno who wrote a work *Περὶ ὅλου*) and ps.Aristotle (but not Aristotle, whose title is *Περὶ οὐρανοῦ*; as argued by Johnson (2019) 79 this should be taken to refer to the ‘heaven’, i.e. the universe, rather than to ‘the heavens’ as usually translated); on the history of this title see further Mansfeld (1992c). The question type ‘what is it’ in the category of substance is treated in §1 and §9, ‘how is it’ in §§2–8. The category of place is touched on in §§3–5. But the most prominent place is taken up in the chapter by the category of quantity, being referred to in §2–3 with regard to number and in §§4–9 with regard to size (§§4–5 equal–unequal, §§6–7 limited–unlimited, §§8–9 unlimited–limited). We note that Philoponus, in outlining the questions related to the various categories, explicitly uses the pair unlimited vs. limited as applied to the cosmos to illustrate the category of quantity (*τὸ ποσόν*); text below in section E(a) General texts.

There are no variants on the chapter heading as confirmed by P^{BGQS} (but note *περὶ τοῦ κόσμου* in C’s introductory words). S gives the chapter’s heading as part of the longer heading of S 1.21 which combines the headings of chs. 2.1, 2.3, 2.5a and 2.5: *Περὶ κόσμου καὶ εἰ ἔμψυχος καὶ προνοία διοικούμενος καὶ ποῦ ἔχει τὸ ἡγεμονικὸν καὶ πόθεν τρέφεται*.

D Analysis

a Context

The chapter follows on from the authorial comment in the Preface to Book 2, where its subject matter is announced (*περιοχήν* in §1 picks up *περιεκτικωτάτου* in 2.prooem.). Much mention has been made of the cosmos in Book 1, particularly in the initial chapters chs. 3–5 and 7. Indeed, as S saw, the subject matter of this chapter overlaps considerably with ch. 1.5 *Εἰ ἔν τὸ πᾶν*. The doxai in A 1.5.1–2, discussing the extent of the cosmos in relation to the universe, are close to 2.1.9 in subject matter. For A 1.5.3 see 2.1.2 (but without mentioning that the single cosmos is finite). The final two lemmata A 1.5.4–5 introduce

argumentation that is wholly missing in ch. 2.1 and is typical of the opening chapters of the work. On these chapters and the overlap between Books 1 & 2 see above on ch. 1.5 and also M–R 2.1.22–24, 52–54. Only in Book 2 does A begin to treat the subject of the cosmos both as a whole and as having constituent parts.

b Number–Order of Lemmata

There are two tell-tale blocks where P and S correspond: P2–3 = S 1.22.3b1–2, P4–7 = S 1.21.3a1–3 & b1. The remaining lemma P1 is separated in the cluster of tenets attributed to Pythagoras at S1.21.6c2. It is natural to follow P and take it as the opening lemma, since it introduces and quasi-defines, by means of the *πρῶτος εὔρετής* motif, the chapter's subject (cf. the definitions in chs. 1.9–12). On this motif see section D(d) §1 below. But the initial position cannot be confirmed from S. There remain the two lemmata found only in S, §§4–5. Diels' reconstruction places them at the end of the chapter for reasons he does not explain. In S they follow on directly from the small block of two lemmata at S 1.22.3b1–2. This encourages the view that they followed on from these same lemmata in A. But the internal logic of the chapter must also be taken into account.

c Rationale–Structure of Chapter

As the numerous doxographical and dialectical parallels demonstrate (see texts cited below), the simple chapter heading is deceptive. It was already noted in section B above that the chapter combines two fundamental questions relating to the cosmos (or universe) as a whole: (1) whether there is but a single cosmos or whether there are infinite kosmoi, and (2) whether the universe (whether to be identified with the cosmos or not) is limited or infinite in extent. It is important to note that the latter is given as a question of physics according to Aristotle and his school in 1.proœm. 3.

The first lemma attributed to Pythagoras, as already remarked, serves to introduce the cosmos, presenting for the purpose a nominal definition. On this see further below section D(d) General points. Next §§2–3 give a diaeresis on whether the cosmos is single or infinite in number. For the former view S gives a long list of eleven name-labels, nine of which reappear in T (missing are Empedocles and Ecphantus; Anaxagoras has been placed third in the list, whereas in S he is eighth). T thus confirms that P has abridged his source with the common formula *καὶ οἱ ἄπ' αὐτοῦ* (also found in P 2.28.2, 3.9.1, 3.10.1, 4.16.4, as well as at S 1.17.1a, 1.18.1d1, where in both cases P preserves a different name-label; see the comment on A 1.17.1 at ch. 1.17 Commentary D(d)§1). G has abridged even further to the name-label Thales only. A occasionally uses such long lists

of name-labels to emphasise widely held points of view (cf. chs. 2.4.7, 2.11.4, 4.5a.1). For the infinitist point of view S gives eight name-labels beginning with the two Milesians Anaximander and Anaximenes (standing in contrast to their archegete Thales who heads the other list). Exactly the same list is found in T. P retains only two of these names, Democritus and Epicurus, but also adds Metrodorus (of Chius). On this name-label and whether it should be retained see section D(d) §3 below. In principle the expression ἄπειροι κόσμοι on its own is ambiguous, since it could refer unlimited successive worlds or unlimited co-existing worlds. The addition of the words ἐν τῷ ἀπείρῳ κατὰ πᾶσαν περίστασιν makes it quite clear that the second alternative is meant, i.e. the atomist position. See further comments at section D(d)§§3–4. It is noteworthy that with his diaeresis A has not taken into account a third possibility, namely that there are a finite number of multiple kosmoi. Plato toys with the possibility of five kosmoi at *Tim.* 55c–d and Plutarch records the view of a certain Petron of Himera that there are 183 arranged in a triangle (on this ‘curious doctrine’ see West (1992) and Zhmud (2015), who argues that the doctrine is Platonizing and its author probably fictional). The three theoretical possibilities are outlined by Philo and Dionysius of Alexandria (cf. also Hermias on Epicurus and Augustine). A then adds the obvious point that an infinite number of kosmoi entails an infinite amount of space in which they are located.

The next two lemmata §§4–5 (found only in S), if placed here as proposed above, expand the second half of the diaeresis and introduce a further distinction among the infinitists, i.e. whether the infinite worlds are equidistant from each other or not. There are no parallels in A for a genitive plural phrase to pick up a previous position, so the initial words τῶν ἀπείρους ἀποφνηαμένων τούς κόσμους may be an addition of S. But in the absence of further evidence they must be retained. Elsewhere A also shows interest in questions involving symmetry and stereometrical location, e.g. at 2.15.1–2. The information provided on Anaximander’s view is not found elsewhere.

The next two lemmata §§6–7 also form an obvious pair. They introduce a further division between a limited and an unlimited single cosmos. The structure is thus chiasmic, returning to the position of §2 after the treatment of the infinitists in §3 and §§4–5. The name-label Empedocles already occurred in the list in §2. Those of Seleucus (only here and at A 3.17.9 where he is called ὁ μαθηματικός) and Heraclides are new. P has abridged here too, deleting Seleucus’ epithet and the name of Heraclides. The doxa of Empedocles is surprising in that it has the revolution of the sun, and not the sphere of the fixed stars as the cosmos’ outer limit. A has a fondness for such exotic Presocratic views; cf. also 2.15.6 attributed to Anaximander–Metrodorus–Crates, where the sun is ἀνωτάτῳ πάντων τετάχθαι. See further section D(d)§6.

The final two lemmata import a new element of terminological precision by introducing the new terms τὸ πᾶν (the universe) and τὸ ὅλον which have so far not occurred in the chapter (but the former is found in the earlier chapter 1.5). §8 follows on from §7 by splitting its two terms, taking ἄπειρος now with the universe, while κόσμος is regarded as limited, as implied in §2 and made explicit in §6. The distinction between πᾶν and ὅλον in §9 turns on the additional factor of the void, which was already briefly introduced as part of the infinitist position in §3. The void has already been introduced in ch. 1.18 and its cosmological role will be further explored in ch. 2.9.

The structure of the chapter is complex not only because it combines two questions and does not treat just one (the same will occur in ch. 2.4), but also because it combines two ways of working with doxai. The three chiastically arranged diaereses (A–B, B₁–B₂, A₁–2) clearly play a central role. The final two lemmata do not form a diaeresis, but add terminological precision to what has preceded. At the same time there are linkages between the doxai that move the chapter along:

- §1 sets the scene by introducing the concept of cosmos.
- §2 develops this in terms of a single cosmos.
- §3 introduces the alternative of infinite kosmoi.
- §§4–5 adds a further distinction in the views of the infinitists.
- §6 by adding the aspect of limit qualifies the position in §2.
- §7 gives the opposed alternative to §6.
- §8 introduces the notion of the universe, which allows a fresh distinction.
- §9 develops the previous view into a more sophisticated position.

The chapter thus has a progressive movement through its doxai that André Laks has aptly called ‘vectorisation’ (cf. M–R 2.317 n. 84 and also the arrows at Laks 1997a, 258). The final words which emphasise the cosmos as a whole also return the chapter to its beginning where it was described as the ‘container’ of all things.

Leszl (2002) 176 (taken over by Bottler (2014) 280) argues on the basis of a comparison with Galenic texts that ‘even an ancient author would have recognized that the organisation of the material in the *Epitomé* is unsound on various points.’ This conclusion is quite erroneous. There is admittedly some overlap between chs. 1.5 and 2.1, but the contexts differ. The former chapter is part of the section introducing the φυσικὸς λόγος. The latter introduces the cosmos as the sum total of physical reality in our world, but allows for the possibility that there are more worlds than ours and that it can be surrounded by a void. The combination of questions goes back to Aristotle and is confirmed by texts such

as those of Philo and Alexander. Bottler (2014) 280 points to the summary of E at *PE* 15.32.8 from which she draws the drastic and wholly unjustified conclusion that E's *Vorlage* here does not correspond to the version of the text in the mss. of P. In fact E shows that he understands the connection between chs. 1.5 and 2.1. E has altered the diaeresis from one vs. infinite to one vs. many, but this alteration is basically trivial, since it does not imply a second diaeresis between multiple and infinite kosmoi recognized by the authors cited above in our discussion of §§2–3. Similarly the phrase πολλούς ... καὶ ἀπείρους at T 4.15 gives an expansion of A's text rather than evidence of a different structure. It would not have been different if he had written ἦ instead of καί, since T is not a slavish copier of A's text. It is worth noting that Ach on successive pages ascribes to Epicurus the view that many kosmoi and that infinitely many kosmoi exist (§5, p. 16.11; §8, p. 17.21 Di Maria). Strictly speaking only the latter is correct.

d Further Comments

Individual Points

§1 The book opens with the πρῶτος εὐρετής motif already used at A 1.3.7 (Pythagoras) and 1.3.17 (Ecphantus); see above on ch. 1.3 Commentary D(d)§7. It recurs in Book 2 at 2.12.2 (Pythagoras), 2.24.1, 2.28.5 (both Thales). A text at D.L. 8.48 (text below section E(a)) shows that the attribution was disputed, with Theophrastus giving the honour to Parmenides, but Zeno the Stoic to the poet Hesiod. Ach records the same tradition as A. See further A 2.12 Commentary B.

This doxa gives a nominal definition of the term κόσμος, the purpose of which is to present a preliminary notion of the subject on which the chapter will focus. Such definitions occur regularly in Book 1. See further the discussion at the Commentary on ch. 1.9, D(d) General points.

For περιοχή used in definitions of the cosmos see esp. Epicurus' definition of κόσμος in *Ep.Pyth.* at D.L. 10.88 (text below section E(a)§1), a text with a likely doxographical background (see further on ch. 2.2). The term later yields ground to σύστημα, but the phrase κατὰ περιοχὴν or the verb περιέχω often still forms part of the definition; for examples in ps.Aristotle and Philo see section E(a)§1 below. On the various meanings of the terms κόσμος and οὐρανός see also the discussion above on §1[7–25] and §1[14–16] in our Commentary on ch. 1.6 D(d).

Sprache der Griechen (app. crit.): Q explains the connotation of the Greek word κόσμος as indicating order (*Ordnung*), which he deems necessary because this connotation is not present in the Arabic term used to translate it. The same phrase is used for similar cases at chs. 3.7.2[6], 4.11.1[17], 4.12.1[9], and 4.19.3[7];

cf. also his adaptation of the chapter heading of 1.8 *Über die hohen Kräfte, welche die Griechen 'Daimones' und 'Heroes' nennen*.

§3 P's addition of the name-label Metrodorus, not found in S or T, gives rise to problems. All four witnesses have a different reading (see apparatus above):

- P^B 'and their (i.e. Democritus' and Epicurus') pupil Metrodorus (of Lampsacus)'
- C 'and his (i.e. Epicurus') teacher Metrodorus (of Chius)'
- Q 'and their teacher Metrodorus'
- B 'and their teacher Leucippus'

Additionally Ach, who follows the same tradition here, supports C (using the word διδάσκαλος instead of καθηγητής). C's reading must be the right one. P^B appears to have confused the two homonymic philosophers. It is worth noting that in his recent edition of C Riedweg records that the lost ms. Capnionius used by Oecolampadius in his 1528 Latin translation must have read μαθητής just like P^B (did contamination occur from P^B to C?), which may explain Diels' reading in the apparatus of *DG* ad loc.

The question remains: was this additional phrase originally present in A? There are arguments *pro et contra*. Arguments for its absence: (i) it is found in neither S nor T; (ii) P could have added it from A 1.5.4 (= S 1.22.3a3); (iii) it interrupts both the list of unadorned names and the chronological sequence. Arguments for its presence: (i) it is not to be expected that P as epitomator would leave it out at 1.5.4 only to insert it here (as suggested by Diels *DG* 62); (ii) it is, on the other hand, quite possible that S moved the phrase to the earlier passage in ch. 1.5 when he cites it in S 1.22.3a3, especially since the two texts are juxtaposed in 1.22.3ab; (iii) the similar phrase in Ach, who reflects the same tradition (and is not directly dependent on the tradition of P). The matter cannot be definitively resolved and it is safest to preserve P's evidence.

It is difficult to choose which of the readings should be followed for the final phrase. S's alternative reading κατὰ πᾶσαν περιαγωγὴν ('throughout the entire revolution') appears to make less sense cosmologically than P's κατὰ πᾶσαν περίστασιν ('throughout the entire surrounding area') since there is no general revolutionary movement in an infinite universe. But, as Alex Mourelatos has reminded us, the turning here could refer to the movement of the head, i.e. in whichever direction one turns one's head.

On T's alternative reading πολλοὺς ... καὶ ἀπείρους see the comment above under section C.

Anaximander's prominent position at the head of the list of 'infinetists' is likely to derive from Theophrastus' report cited by Simplicius, fr. 12A9 DK and especially the phrase (not part of the famous quotation) ἐξ ἧς (sc. ἑτέρα τις φύσις ἀρχή) ἅπαντας γίνεσθαι τοὺς οὐρανούς καὶ τοὺς ἐν αὐτοῖς κόσμους. Kahn (1960) 46–48 plausibly argues that the ascription of 'infinite kosmoi' to Anaximander may be the result of an assimilation of Milesian cosmology to the later cosmology of the atomists. This was already argued by Cornford (1934), whose argument against Burnet—though based on a now wholly outdated interpretation of the doxographical evidence—that this doctrine commenced with the atomists has been generally accepted. However, the latest examination of Theophrastus' evidence is more cautious: Mansfeld (2011a, 25) 'As to "all the world-systems" I do not know how one is to decide between successive ones on the one hand and contemporaneous ones as well as successive ones on the other.'

The other non-atomists on the list are Anaximenes, Archelaus, Xenophanes and Diogenes. Anaximenes and Diogenes are reported by Simplicius as among those who regard the cosmos as subject to genesis and destruction, but in an eternalist sense in terms of successive worlds. Such a view may lie behind the attribution of the doctrine of κόσμοι ἄπειροι to Xenophanes and Diogenes in Diogenes Laertius 9.19 and 9.57 respectively; cf. on Diogenes Laks (2008) 200. On Simplicius' text see further Section D(e) below. It is very unlikely that Archelaus has a rightful place in the list, given that he was a follower of Anaxagoras in his cosmogonical thought. It may be suggested that A or his source wished to balance out the two lists and so placed as many names as he could justify on whatever grounds to the second list.

§4 It is possible that Cicero's phrase *longis intervallis* in relation to Anaximander at *ND* 1.25 reflects the doxa on distance between kosmoi in §4 as suggested by Heath (1913) 29.

§6 Couprie (2020) links this cryptic lemma up with information about the sun's movement at A 2.23.4. In this doxa the sun at the solstices bumps into the crystalline heaven and can go no further. Thus its revolution is equivalent to the circumference of the heaven, and so is the same as that of the entire cosmos. See further ch. 2.23 Commentary D(c)(2).

§7 On this lemma Russo (1995) 148 rightly notes that its doctrine is consistent with the heliocentric theory attributed to Seleucus by Plutarch at *QPlat.* 8.1 1006C and perhaps implied by the doxa at A 3.17.9. But consistent with the method of the *Placita*, the argument underlying the position is not given. Daiber ad loc. notes additional material on Seleucus furnished by Abū Bakr ar-Rāzī (Rhazes): 'Er (sc. Plutarch who has just been cited with a quote from A 1.5.4) berichtet von Seleukos, er habe bei seiner Behauptung, diese Welt sei unendlich, damit argumentiert, daß er sagte: Wenn die Welt begrenzt ist, wird

sie dann durch etwas oder durch nichts begrenzt? Falls sie nun durch etwas begrenzt wird, entspricht das meiner Behauptung. Wenn sie aber durch nichts (begrenzt wird), ist es möglich, daß sie sich dem Nichts anpaßt und daß sie das Nichts berührt, ebenso wie sie durch Nichts begrenzt wird.' The source of this material is unclear. The presentation of an argument is foreign to the rest of what we find in 2.1, so *pace* Bottler (2014) 288 it is not so likely to derive from a richer version of either A or P.

§8 Here S reveals that P has removed the additional name-label of Melissus. Both here and in §2 Diogenes is most likely the Presocratic, not the Stoic. It is to be noted that Diogenes' name occurs in §3 (infinetists), Melissus' name in §2 (unicists). But κόσμος here refers only to 'this cosmos in which we live' (and so introduces a new distinction which is further developed in §9). Therefore there does not need to be a contradiction with §3 (and it is the doxa that counts).

§9 S leaves out the final phrase for which there is ample evidence in P. The right reading without οὐ is preserved by C and Q. G has a lacuna at this point; the transmitted πᾶσιν conceals the original τὸ ὅλον, as argued by Jas ad loc.

e Other Evidence

A special case in the proximate tradition is Achilles. Although his chapter on the being of the heaven (where οὐρανός is taken for the most part as equivalent to κόσμος) is in general quite different from A 2.1 (and also contains material parallel to chs. 2.5–6 and 2.11), it does include three brief sections which are closely parallel to §§1, 3 and 9. These sections must derive from a doxographical tradition much closer to A than in other parallel texts. We can speak of a *traditio proxissima* (on Ach as a cousin-text of A see M–R 1.305). Verbal equivalences are, however, limited.

Quite recently Rashed (2011) 487 has published an important scholion (no. 539) from the lost Commentary of Alexander of Aphrodisias on Aristotle's *Physics* (text below section E(a) General texts). It comments on 250b18 and demonstrates that the well-known text in Simplicius' Commentary 1121.5–1122.1 derives essentially from the earlier commentary. The doxographical schema set out in this text combines the question of the number of kosmoi, whether single or unlimited, and the question of its/their coming into being and destructibility. It thus combines the treatment of questions that A separates into chs. 2.1 and 2.4 and shows a clear resemblance to the schema in Philo *Aet.* 7–19, though including more complexity and more name-labels. The main discussion of this text must be reserved for the Commentary on 2.4. But at this point a comparison can be made with the name-labels listed by A in §§2–3. We can set out the differences as follows, making reference to the five groups into which the scholiast's schema is divided:

(1) In group 1 the scholiast agrees with A §3 that Democritus, Anaximander and Epicurus (in that order!) posit infinite kosmoi;

(2) The scholiast's group 2, consisting of those who posit a single cosmos that undergoes cyclical generation and destruction, has five members; of these (a) Anaximenes and Diogenes are located among the infinitists in A §3, whereas (b) Empedocles, Heraclitus, and the Stoa have a place among the unicist group in §2 (but with the name-label Zeno instead of the Stoa).

(3) But two of A's infinitists are included by the scholiast among the unequivocal unicists; (a) Archelaus is placed with Anaxagoras in group 3, and (b) Xenophanes is placed in group 5.

(4) Metrodorus in A is the atomist from Chios, whereas—as noted by Rashed (2011) 490, who corrects Diels 70A5 DK on this point—the one to whom the scholiast refers in group 3 as a unicist must be the follower of Anaxagoras from Lampsacus.

This comparison shows that Alexander's schema as preserved by the scholiast reaches a quite different result than A's diaeresis in ch. 2.1. The reason for this is that its main focus is on the question of the coming into being and destruction of the cosmos/kosmoi, which A will treat in ch. 2.4, whereas A concentrates on the opposition between one and infinitely many. See further our discussion in the Commentary on that chapter, section D(e). The comparison also reinforces our suggestion above at section D(d)§3 that A wished to shift as many names to §3 in order to balance out the multiple listing of name-labels.

Commentary

A Witnesses

All three major witnesses testify to this chapter.

(1) P has the same four witnesses as in ch. 2.1, P^B, C, G and Q, with E again omitting the chapter. All four preserve the same four lemmata, with G mak-

ing various abridgements (including the chapter heading) and alterations. On a possible fleeting reference to P's text of this chapter in Julian the Arian see A 2.12 Commentary A.

(2) S does not include material from this chapter in his cosmological chapters (1.21–26), but had earlier added it to his chapter 1.15 *Περὶ σχημάτων*, which is part of the section of his work dealing with principles and foundational physical concepts (1.10–20). P's first lemma is located at 1.15.6b1, followed by another identical view but with the name-labels Leucippus–Democritus. The anonymous lemmata in P are left out. More surprisingly S also omits the Epicurean lemma in P, perhaps because it spoils the transition to the subject of the cosmos' inclination (see M–R 1.219, 234). There is no more material in S's chapter that can attributed to this chapter with any certainty (the brief introductory lemma on Plato at 1.15.4 is best regarded as S's own addition). Thus S adds only one lemma to P, making five in total.

(3) T reduces the chapter to a single diaeresis between two views, the former corresponding to P's first lemma and the two in S, the other summarizing the remaining lemmata in P. Each view is represented by a single adjectival term, *σφαιροειδής* and *έτεροειδής* respectively.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* By the time that A compiled his work in the first cent. CE the standard cosmological model was completely dominant and the question of the shape of the cosmos (and the heaven) was regarded as proven; see for example Strabo 2.5.2 (cited below Section E(b) General texts). However, the question of the cosmos' shape was retained as a standard *quaestio infinita* in the area of natural philosophy, as numerous dialectical and rhetorical texts listed below testify. Cicero develops the opposition as part of his argument between Epicurean and Stoic cosmo-theology in *De natura deorum* Books 1 and 2. In Patristic authors (including T) a sceptical position is adopted, since the Bible is not concerned with such matters. Views are recorded on this question for the atomists and Stoics, but not for other early Greek philosophers.

For this chapter too the evidence in Ach forms a special case. He (and the paraphrase based on him in the *Scholia in Basilium*) records the same list of three options as in §§1–3 and must go back to a closely related *Placita* tradition. Of particular interest is his identification of the second lemma with the view of the Orphics. See further D(d) and (e) below.

(2) *Sources.* The antithesis between the standard cosmological model, in which there is a single spherical cosmos, and the atomist model with an infinite diversity of kosmoi as was developed in the period up to the fourth century BCE also forms the main background for this chapter. In the latter model a dis-

inction is made between *our* cosmos and other kosmoi. Our cosmos, with its heavenly bodies apparently moving in circles, is regarded as basically spherical in shape; see the key text at Diogenes Laertius 9.31 cited below Section E(a)§4. The atomist description of the origin of the cosmos in ch. 1.4 also assumes sphericity, although it is not made explicit. Why this should be the case, given the atomist vortex model, is quite a puzzle (Furley (1987) 143). The earth is not regarded as spherical; cf. A 3.10.4–5. Other kosmoi can of course have all manner of possible shapes.

But what are the sources for the alternative shapes of the cosmos given in §§2–3? Interestingly these are found in various texts which explore alternative shapes for the cosmos in order to demonstrate by a *reductio ad absurdum* that the shape of the cosmos must be spherical. This commences with Aristotle, who uses as alternatives the shapes *ῥοειδής* and *φακοειδής*, while in Euclid we find *κωνοειδής* and *κυλινδροειδής* (also references to conic shape in Adrastus and the astronomers cited by Simplicius); for all these texts see below Section B(b) General texts. For Epicurus, however, these shapes are not just theoretical, but are actually likely to occur somewhere in the infinite space of the universe (see D.L. 10.74; he too suggests ‘egg-like’ kosmoi). We note here that A’s predilection for adjectives ending in *-ειδής* builds on terminology developed in these earlier texts. To express this terminology we have translated such terms literally in the translation above, including ‘like a ball’ for the key term *σφαιροειδής* (the Dutch term ‘balvormig’ is even better, but has no equivalent in English, cf. also ‘ballförmig’ in German).

C Chapter Heading

The heading of the standard umbrella type *Περὶ x*, as found in the majority of texts in the P tradition (and the index at the beginning of the Book), corresponds to parallel headings elsewhere in the work (see the list under *loci Aetiani* above). The quaestio involved belongs to the category of quality, as clearly formulated by Philoponus at *in APo.* 239.1, *ὅταν δὲ πότερον σφαιροειδής (ὁ κόσμος) ἐστὶν ἢ ποῖον ἕτερον ἔχει σχῆμα, τὸ ποῖον (ζητούμεν)*; cf. also Ambrose *Hexaem.* 1.6.21 *de qualitate caeli*. S alludes to the heading with his more general *Περὶ σχήματων* at *Ecl.* 1.15, where he combines doxai from this chapter with those from A 1.14.

The abridged heading in P^G reflects his occasional practice elsewhere, leaving the precise contents of the chapter unclear (cf. §§54, 57, 68). It certainly does not represent P’s original title. An interesting alternative heading is given in a marginal gloss in P^B Ambrosianus C 126, *εἰ σφαιροειδεῖς (sic) ὁ κόσμος ἢ κυμβοειδεῖς (sic)*. The second adjective (‘cup-shaped’) is likely a scribal error (it is not otherwise found in extant ancient Greek literature according to the TLG).

It may be a corruption of κυβοειδής ('like a cube'), which is sometimes used of the earth, e.g. at Cleomedes 1.5.15 & 98, but suggested for the cosmos at Marius Victorinus *in Rhet.* 1.8, p. 31.20–24 Riesenweber (on Cic. *Inv.* 1.8 *quae sit mundi forma?*) '*quae sit mundi facies*' ... *multi quadrata*. This shape is not, however, used of the earth in A 3.10.

Titles commencing with εἰ are quite common in A (cf. chs. 1.5, 2.3–4, 4.4–5 etc.), taking over the typical formulation of a θέσις (see, for example, Alex. Aphr. *in Top.* 40.19–23). But there are no examples containing alternative views in the actual title of a chapter.

D Analysis

a Context

After introducing the cosmos and discussing its numerical and spatial aspects in ch. 2.1, the views on its shape are now presented. The same sequence is found at 2.13–14 on the stars, but not at 2.20–22 on the sun and 2.25–27 on the moon, where a chapter on size is interposed. The Aristotelian categories of essence and quality can be recognized. On this background see further M–R 2.1.10–14.

b Number–Order of Lemmata

As noted above, there are five lemmata in all. S has one lemma in addition to the four in P, so the question must be answered as to where it should be placed. As well seen by Diels, the only logical place is after the first three lemmata in P and preceding the Epicurean lemma at the chapter's end. The particle δ(έ) in the final lemma thus forms an antithesis with the lemma that P omitted. It is to be noted that §4 is the only lemma without a connecting particle, but one may have been omitted by S (e.g. μὲν).

c Rationale–Structure of Chapter

The first three lemmata explore the shape of a single cosmos by means of a diaeresis in the form of a list with three alternatives. The Stoics represent the spherical option. Interestingly they play the same role in subsequent chapters on the shape of various cosmic bodies, i.e. 2.14, 2.27 and 3.10 (but not 2.22). On the third option, an 'egg-like' shape, see further below (d). It may seem odd that §4 appears to repeat the same doxa as §1. The only plausible reason that can be given for this move is that it must be linked with the basic division between unicists and infinitists in 2.1. The Stoics represent the former, the two atomists Leucippus and Democritus the latter. Since the doxa speaks of the cosmos in the singular, they must be speaking about the cosmos we inhabit. In contrast to their view is the doxa attributed to Epicurus, which speaks of κόσμοι in the plural and emphasizes the possibility of other shapes. In total, therefore, the

chapter is structured through no less than four diaereses (see the diagram at M–R 2.327). We note that the final diaeresis introduces an additional element into the chapter which is not anticipated in its heading. The antithesis which it records is rather artificial or even unsatisfactory, since there is no evidence to suggest that the thought of Leucippus and Democritus on this matter differed from their later fellow-Atomist Epicurus. It cannot be agreed with Luria (2007) 1127 that Epicurus is polemicizing with his predecessors; it is the doxographer who establishes the contrast.

It must be observed, however, that in the final doxa A indicates the possibility of multiple kosmoi with differing shapes with the term ἐνδέχασθαι, used here for the first time in the work. In three other texts it is used of Epicurus (2.13.15, 2.22.4, 3.15.11), all in the final position as here; it is also attributed to Plato in 3.15.10 (not in final position) and to Diocles in 5.14.3. There can be no doubt that for A it is a *vox Epicurea*, taken by the doxographical tradition from texts such as Epicurus' *Letters*, where it is used very frequently to convey the doctrine of multiple explanations and/or causes. (The term is not recorded in the surviving fragments of Democritus or in reports of his doctrines.) The direct source of the doxa could be *Ep.Pyth.* 88, but it would then have to be an extrapolation since this text speaks of our cosmos and gives various shapes which are possible because there is no direct perception of its outer boundary. Earlier in the letter at §74 he speaks about multiple shapes of kosmoi, giving ball-like, egg-like and 'other-shaped' as examples, but here the term ἐνδέχασθαι is not used as it is in the subsequent text.

Epicurus in fact occupies a special and almost unique place in the history of the *Placita*. His views are frequently recorded throughout the five books, often in combination with other members of the atomist tradition but also no less often on their own. However, a close study of his extant writings—especially the *Letters*—shows that he also made use of early literature related to the *Placita* in order to find examples of multiple explanations and/or causes as attributed to earlier philosophers and scientists. (The only other philosopher who occurs in the *Placita* but also made use of *Placita* material is Chrysippus; see below at ch. 4.5 Commentary D(e).) On Epicurus' presence in the *Placita* and his use of the *Placita* tradition see further Introduction to Book 2 section 5, and also the detailed analysis in Runia (2018). On the connection between multiple explanations and doxography see *ibid.* 400–403, and also Bakker (2016) 58–62.

d Further Comments

Individual Points

§3 The additional comment given by Ach is of great interest: ἡς δόξης ἔχονται οἱ τὰ Ὀρφικά μυστήρια τελούντες. It could be the work of Ach himself. But the

Orphics are also mentioned at A 2.13.14, so the information here was probably present in the *Placita* tradition, but was left out by A. The reading of P^G, κυκλοειδῆ, is best explained as a *Verschlimmbesserung*, the result of regarding the reading ὠρειδῆ as implausible (he would thus be unaware of the tradition attributing this view to the Orphics). It is possible, however, that the doxa may implicitly refer to Empedocles, since at A 2.31.4 the cosmos is portrayed as lying on its side like an egg. On the translation of ὠρειδῆς see the comment ad loc., Commentary D(d)§4.

§5 It is possibly that Cyril's σχηματισμοῖς preserves an authentic reading since the term σχηματισμός is in general much rarer than the corresponding σχῆμα, but is used by A on four occasions (1.4.1[23], 1.15.6, 3.2.6, 5.13.1).

e Other Evidence

After citing the comment on the Orphics Ach continues as follows (§6, p. 16.12–15): σαφηνείας δὲ ἕνεκα πιθανῆς παρελήφθη τοῦ ὥου ἢ εἰκῶν. ἄμεινον δὲ σφαίρας ἐκδέχεσθαι σχῆμα ἔχειν τὸν οὐρανὸν καὶ τὰ ἐν αὐτῷ κατὰ τὸν Ἐμπεδοκλέα, ὃς ἔφη οὕτως: 'σφαῖρος κυκλοτερὴς μονίῃ περιγέει χαίρων'. The adjudication between doxai is unusual in the *Placita* (but see ch. 1.2.2, 1.3.1–2). The same verse of Empedocles (31B27.4, 28.2) is cited in S at 1.15.2b. Both S and Ach read χαίρων for the last word as against γαίωv in the quote from Simplicius preferred by Diels VS (Wachsmuth wrongly emends). It is just possible that S derived the verse from A and that Ach reflects the same tradition. This would mean that the quote was given to illustrate the first doxa, a method also used in 1.18.2 (Empedocles again). Could the reading of P^G in §3, κυκλοειδῆ, be a remnant of this verse? But such an inserted verse does not fit in well with the μέν ... δέ construction in §§1–3. The possibility is far too uncertain to warrant inclusion in the reconstruction of the text.

§1 Stoics: **Plato** *Tim.* 33b σχῆμα δὲ ἔδωκεν αὐτῷ τὸ πρέπον καὶ τὸ συγγενές. τῷ δὲ τὰ πάντα ἐν αὐτῷ ζῶα περιέχειν μέλλοντι ζῶω πρέπον ἂν εἴη σχῆμα τὸ περιειληφὸς ἐν αὐτῷ πάντα ὅποσα σχήματα· διὸ καὶ σφαιροειδὲς, ἐκ μέσου πάντη πρὸς τὰς τελευτὰς ἴσον ἀπέχον, κυκλοτερές αὐτὸ ἐτορνεύσατο, πάντων τελεώτατον ὁμοιότατόν τε αὐτὸ ἐαυτῷ σχημάτων ... **Philo of Alexandria** *Prov.* 2.56 *Aucher figura autem muni, sicut et mundus ipse ... per providentiam globi in formam facta fuit. primum, quia omnia figura velocius mobilis est ... occurrunt autem in Timaeo*

Platonis (33b), qui mirifice laudent figuram perfecte sphaericam cum sua utilitate, atque commendent, ita ut nullo praeterea indigeat laudis additamento.

Cleomedes *Cael.* 1.5.6–9 Todd ἂν τοίνυν ἐπιδείξωμεν ὅτι τὸ στερεώτατον αὐτοῦ (sc. ὁ κόσμος) καὶ πυκνότατον μέρος, ἡ γῆ, σφαιρικῶς κέχρηται τῷ σχήματι, ῥαδίως ἂν ἀπὸ τούτου ἐπὶ τὰ λοιπὰ τῶν μερῶν αὐτοῦ μετιόντες καταμάθοιμεν ὅτι πάντα σφαιρικά ἐστί καὶ οὕτως καὶ ὁ σύμπας τοιοῦτον ἔχει τὸ σχῆμα.

Appendix: A Missing Chapter Περὶ κινήσεως κόσμου?

At CAG 4.16 a section of T's summary of A's chapters on the cosmos reads (p. 104.15–20 Raeder):

καὶ οἱ μὲν σφαιροειδῆ τοῦτον εἶναι, οἱ δὲ ἑτεροειδῆ· καὶ οἱ μὲν μυλοειδῶς, οἱ δὲ τροχοῦ δίκην περιδινεῖσθαι· καὶ οἱ μὲν ἔμψυχόν τε καὶ ἔμπνουν, οἱ δὲ παντάπασιν ἄψυχον· καὶ οἱ μὲν κατ' ἐπίνοιαν γενητόν, οὐ κατὰ χρόνον, οἱ δὲ ἀγέννητον παντελῶς καὶ ἀνάτιον· καὶ οὔτοι μὲν φθαρτόν, ἐκείνοι δὲ ἀφθαρτον.

The summaries of A 2.2 and A 2.3–4 can immediately be recognised. But in between them are the words in italics which have no equivalent in the remains of A found in P or S. Undoubtedly what we have here is what we have called an Aëtian 'enclave' (see General Introduction, section 2.4–5). This was already recognized by Diels, who regarded them as derived from A and placed them (*DG* 329) beneath the text of 2.2, numbering them as 2.2.4. Four additional considerations point to the fact that Diels was on the right track.

(1) It is apparent that in his chapters on the cosmos, the stars, the sun, the moon and the earth A follows a fixed sequence of topics, which we have argued go back to question-types first formulated by Aristotle and loosely based on his theory of the categories: cf. Mansfeld (1990a) 3193–3208; (1992a) 93; M–R 2.5–6, 112. For example for the earth we have in ch. 3.9–13 Περὶ γῆς καὶ τίς ἡ ταύτης οὐσία καὶ πόσαι (substance and quantity), Περὶ σχήματος γῆς (quality), Περὶ θέσεως γῆς and Περὶ ἐγκλίσεως γῆς (place), Περὶ κινήσεως γῆς (motion relating to all the categories). A chapter Περὶ κινήσεως κόσμου would fit in very well in a parallel sequence of chapters on the cosmos. Similar chapters on other heavenly bodies are ch. 2.16 Περὶ τῆς τῶν ἀστέρων φορᾶς καὶ κινήσεως, 2.23 Περὶ τροπῶν ἡλίου, 2.24 Περὶ ἐκλείψεως ἡλίου, 2.27 Περὶ φωτισμῶν σελήνης, and 2.28 Περὶ ἐκλείψεως σελήνης. In addition there is a chapter on motion in Book 1, 1.23 Περὶ κινήσεως, which precedes a chapter on generation and destruction, 1.24 Περὶ γενέσεως καὶ φθορᾶς. A similar sequence would occur in Book 2 on the cosmos, if a chapter Περὶ κινήσεως κόσμου preceded 2.4 Εἰ ἀφθαρτος ὁ κόσμος.

We may also compare the sequence in Book 4 on the soul: 4.6 Περὶ κινήσεως ψυχῆς, 4.7 Περὶ ἀφθαρσίας ψυχῆς.

(2) The early chapters on the cosmos in Ach, a ‘cousin-writing’ of A, show a similar sequence: §5 Τίς οὐσία οὐρανοῦ (= κόσμου), §6 Περὶ σχήματος κόσμου, §7 Περὶ περιφορᾶς. Since Ach and A share common earlier doxographical traditions, it is likely that A would have dealt with the subject of the cosmos’ revolution as well.

(3) There is a fine parallel for alternative views on the motion of the cosmos in Epicurus *Ep.Pyth* at D.L. 10.88 (text above, section E(a)§5), where the outer edge of the cosmos is described as either ‘in revolution or in rest’. It is very likely that Epicurus here made use of a very early doxographical tradition; cf. Runia (1997), Bakker (2016), Runia (2018) 406.

(4) There is a striking linguistic parallel between T’s text which speaks of a whirling movement τροχοῦ δίκην and the description of the earth’s movement at A 3.13.3 Ἡρακλείδης ὁ Ποντικός καὶ Ἐκφαντος ὁ Πυθαγόρειος κινουσι μὲν τὴν γῆν, οὐ μὴν γε μεταβατικῶς, ἀλλὰ τρεπτικῶς, τροχοῦ δίκην ἐνηξονισμένην ἀπὸ δυσμῶν ἐπ’ ἀνατολὰς περὶ τὸ ἴδιον αὐτῆς κέντρον. Exactly the same phrase is used, which suggests that T will have derived it from A, but from another text than 3.13.3.

The layout presented by Diels in the *DG* suggests that these doxai should be added to the present chapter. In our view, however, it is more likely that they point to the possibility of an additional chapter in A with the heading Περὶ κινήσεως κόσμου that was passed over by P in the process of epitomisation and not utilised by S. If this is correct, it will be one of the very few chapters not included by P (see the discussion at M–R 1.186). S may have passed over the diaeresis because it is anonymous and he often leaves out such lemmata which are difficult to include in his coalesced clusters.

Diels suggested that the two alternative kinds of motion—like a millstone and like a cartwheel—might go back to the thought of the Milesians Anaximenes and Anaximander respectively, his inspiration being the description of Anaximander’s view on the motion of the sun in terms of a cartwheel (referred to A 2.20.1, cf. 2.25.1 on the moon). He included the former in *VS* (3A12 = 13A12 DK), but not the latter. See now Anaximander fr. 135, Anaximenes fr. 112 Wöhrle. It is very difficult, however, to determine how the contrast between the two kinds of motion might be explained. For some suggestions see the discussion at M–R 2.334. Couprie (2018) 123 rightly notes that in this text it is the cosmos that is moving, not the heavenly bodies as in the reports on the Milesians. In a private communication he also points out that in the archaic period the millstone was not horizontal as it became later, but stood vertically. This makes the contrast between horizontal and vertical movement suggested at M–R 2.334 less persuasive.

Another fragment that might possibly be assigned to this missing chapter is found at S 1.21.3b. It is the second of a cluster of three Stoic doxai (p. 183.1–2 Wachsmuth): μήτε αὔξεσθαι δὲ μήτε μειοῦσθαι κόσμον, τοῖς δὲ μέρεσιν ὅτε μὲν παρεκτείνεσθαι πρὸς πλείονα τόπον, ὅτε δὲ συστέλλεσθαι. Diels placed this as part of 2.4, but no reason can be given why it should be placed in a chapter on the cosmos' genesis and destruction. On the other hand, increase and diminution are types of motion in the Aristotelian scheme (mentioned as such at S 1.19.1, almost certainly from AD). We think it possible that it derived from the chapter on the cosmos' motion. On the Stoic doctrine involved (expansion and contraction, but no increase or diminution because the amount of matter remains the same) see Hahm (1977) 32 and n. 16.

In our *Specimen reconstructionis* we included this postulated missing chapter with its three doxai as part of our reconstruction, naming it ch. 2.2a: see M–R 2.331–336. The matter remains speculative, however, and we have decided not to include hypothetical chapters of this kind in the present edition. See further General Introduction, section 2.8 and n. 83.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

(1) P is well attested, with seven witnesses in all. P^{BQC} preserve three lemmata, with only minor differences. Oddly, E omits the first lemma, perhaps because of its similarity to the title (but he had referred to it earlier in Book 7 when in contrasting Hebrew and Greek theology he anticipated the contents of this chapter, as well as chs. 1.7, 2.4). G retains all three lemmata but introduces significant alterations (τὸ αὐτόματον instead of τὰ ἄτομα, μήτε προηγουμένης μήτε κατὰ συμβεβηκὸς instead of κατὰ συμβεβηκὸς οὐ προηγουμένης). Ps retains only the title in the shorter form. Sy writes it out in full but in the chapter itself he

immediately turns to the question of whether the heavenly spheres are ensouled, which is not explicitly broached in A or P; but see further on ch. 2.16.

(2) S provides four lemmata that must be assigned to this chapter. They are all found in 1.21, the title of which alludes to the Aëtian source (see section C below). In 3c the first two lemmata in P are written out. The name-label of Leucippus added to the second and the wording of this doxa differs significantly from P. P's third lemma is found at 6b. It is preceded by the Ecphantus lemma in 6a, which given its contents and wording must come from 2.3.

(3) T paraphrases with extreme concision, so is of no value for the text. But he does retain the chapter's main distinction, which he formulates with the terms ἐμψυχόν τε καὶ ἔμπνοον and παντάπασιν ἄψυχον, and thus makes more explicit than does A. He gives an even briefer formulation of the same distinction at 1.63, οἱ μὲν ἔμπσυχον ..., οἱ δὲ ἄψυχον.

For the evidence of Ach in the tradition close to A see section D(e) below.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The subject of this chapter, with its antithesis between a teleological view of the cosmos' formation and/or structure and the non-teleological view that it is the result of forces to be attributed to necessity or chance is very common in the anterior and later doxographical traditions, with numerous texts in Lucretius, Cicero, Philo, Plutarch, Galen, Plotinus, Augustine and others; see the texts cited below in Section B(a). A number of rhetorical texts show that the themes of the chapter are also used as illustrations of *quaestiones generales* or θέσεις. A text in Quintilian *Inst.* 5.7.35 is particularly revealing, formulating the *quaestio* in the form of the classic antithesis 'whether the world is brought about through a coming together of atoms or is ruled by providence,' reversing the order that we find in A. Sopater gives as a *quaestio* (ζήτημα) the other theme of the chapter, 'whether the cosmos is living'. The same *quaestio* in the form found in A's title is mentioned in a Stobaeian excerpt from the Imperial Cynic philosopher Demonax when he is upbraiding certain people for inquiring about cosmological themes while ignoring their own indecorous behaviour (the subject of A 2.2 is also mentioned).

The link with the theme of providence is made in numerous texts, nowhere more succinctly than in Marcus Aurelius 4.3.2 ἤτοι πρόνοια ἢ ἄτομοι. Many of these, however, have an explicit theological formulation wholly missing in A. A very full example is found at Epictetus 1.12.1–2, with five positions (denial of God's existence, denial of providence *tout court*, providence only of the heavens (cf. §4 in our chapter), providence of earthly regions too, providence of individuals). On these doxographies see Runia (1996) 564 = M–R 3.362. In contrast A's approach in this chapter is cosmological and not theological. The ques-

tion of providence is scarcely noted in the chapter on theology 1.7 (only briefly at A 1.7.1[35–41]); cf. also 1.25.5 (on Plato). There is no separate chapter *Περὶ προνοίας*. The theological formulation, as given for example in Theon rhetor, *εἰ προνοοῦσι θεοὶ τοῦ κόσμου*, was more common than the cosmological one found in Quintilian and discussed above. The formulation *προνοία διοικούμενος* in the chapter heading is plainly indebted to Stoic philosophy, in which it is a common phrase, attributed to Chrysippus for example by Arius Didymus fr. 31 Diels and Sextus Empiricus *M.* 7.432 (the latter text plainly influenced by doxographical texts).

(2) *Sources*. The view that the cosmos is animate and ensouled is by no means foreign to early Greek thought but not explicitly formulated (it is anachronistically attributed to Thales and Pythagoras in doxographies preserved in Diogenes Laertius *V.P.* 1.27 and 8.25). Implicit is the macrocosm–microcosm relation first formulated by Democritus (68B34 DK, cf. also Arist. *Phys.* 8.2 254b24–28). But for the later tradition it is first placed on the map through Plato's emphatic presentation of the cosmos as a ζῶον ἐμψυχον ἔννοον τε which comes into being διὰ τὴν τοῦ θεοῦ ... πρόνοιαν (*Tim.* 30b8–c1). This cosmobiology is taken over and developed further by the Stoa; see Hahm (1977) 57–90. In the important formulation of the topics of physics in D.L. 7.132–133 the subject of whether the cosmos is ensouled or not and whether it is administered by providence are joined together with the question of its destructibility (cf. ch. 2.4). The contrast of this teleological approach to the cosmos' development with the non-teleological view of the atomist tradition was already emphasised by Plato in Book 10 of the *Laws* (esp. 889b–c; text below Section B(b) General texts). A special position is taken by Strato, who is not an atomist but is linked with them in denying that the cosmos is animate (Plu. *Adv.Col.* 115B = fr. 35 Wehrli, 20 Sharples; cf. Lact. *De ira Dei* 10.1 = fr. 19C Sharples). He attributes the cosmos' rational structure to the unconscious workings of nature. This subtlety is not picked up by A.

C Chapter Heading

The chapter heading is composite, combining the two subjects dealt with in the chapter. It departs from the standard umbrella type used so far in the book and denotes the two *quaestiones* explicitly by commencing with the conjunction *εἰ*. The only previous instance has been at ch. 1.5 *εἰ ἔν τὸ πᾶν*, one of the three 'cosmological' chapters at 1.4–6. As noted above, these two *quaestiones* are common in rhetorical texts. They fall under the categories of substance and quality.

Most witnesses agree on the longer heading, which combines the two subjects dealt with in the chapter. The exceptions are G, Ps and the Planudean

mss. of P^B, who omit the second half. The longer title is also attested by S, who includes it in his composite heading for *Ecl.* 1.21, which combines the headings of chs. 2.1, 2.3, 2.5a and 2.5: *Περὶ κόσμου καὶ εἰ ἔμψυχος καὶ προνοία διοικούμενος καὶ ποῦ ἔχει τὸ ἡγεμονικὸν καὶ πόθεν τρέφεται*. It must certainly be retained.

D *Analysis*

a Context

The continuity of the themes relating to the cosmos is better preserved if indeed there was a chapter on the cosmos' motion has fallen out or epitomised away after ch. 2.2 (see the Appendix to ch. 2.2 above). Implicit is the further question: how is that motion caused? The topic is approached through the question of whether the cosmos is ensouled, i.e. is it a living being or not. The question of its providential administration is linked in as a related theme. The connection derives from the implications of its having a soul, which given the cosmos' regular movement and teleological structure, must be rational. The answers will have important implications for the following chs. 2.4–8.

b Number–Order of Lemmata

The witnesses yield four lemmata in total. There is no reason to conclude that the chapter is not complete. The order of the doxai in P and S correspond, with the doxa of Ecphantus added between the second and the third in P. It may be assumed that S preserves the original order, into which he has inserted additional material in his 1.21.4–5.

c Rationale–Structure of Chapter

As the title indicates, the chapter combines two separate subjects on the cosmos: A whether the cosmos is ensouled (A₁) or not ensouled (A₂); and B whether it is administered by providence (B₁) or is constituted by a non-rational natural force (B₂). In theory these can be combined to yield four doxai. The method is reminiscent of ch. 2.1, where two subjects are also combined.

The first two doxai plainly form a strong diaphonia, giving opposed views on the two subjects of the chapter, i.e. A₁–B₁ and A₂–B₂. Both oppositions are well-attested in the doxographical, philosophical and rhetorical traditions (see above section B). The formula *οἱ μὲν ἄλλοι πάντες ... Λεύκιππος δέ κτλ* indicates a majority–minority division of opinion (a similar method is found in ch. 1.14 *Περὶ κενοῦ*).

The final two views are best seen as compromise views, rather than mechanically filling out the two remaining views of the grid (i.e. A₁–B₂ and A₂–B₁). Ecphantus is an atomist, just like the proponents of the second doxa, but he believes in the cosmic role of providence. It is to be noted that the doxa attrib-

uted to him does not explicitly state that the cosmos is not ensouled. The parallel text in Hippolytus (see below under Section E(a)§3) confirms that his atomic bodies 'are moved by a divine force which he also calls intellect and soul'.

The final doxa attributed to Aristotle is also a kind of compromise view. The heavens are ensouled and providentially administered (i.e. A1–A2), the earthly regions are not (A2–B2). This view is consistent with a doxographic tradition in which for Aristotle divine providence is exercised directly in the heavenly realm and only indirectly in the regions below the moon; see the collection of texts in listed in Moraux (1984) 571 n. 33 (who thinks the doctrine is a doxographical invention), Runia (1989) 27, and a selection below Section E(a)§4. The Aristotelian doxography in Diogenes Laertius is a good parallel, but with a more theological emphasis. It uses the Stoic (and non-Aristotelian) term *συμπάθεια* to explain the rule of order on earth, for which A uses the more Aristotelian expression *κατὰ συμβεβηχός*. See also the related view in the next chapter, A 2.4.12. It differs from the classic Aristotelian position expounded in *Met.* A 7. Alexander *Quaest.* 2.21 argues that providence is not accidental (*κατὰ συμβεβηχός*) according to Aristotle, claiming at the end of the discussion that the subject is not easy and that none of his predecessors have developed an adequate analysis of it within the context of Aristotle's doctrine. He also promises to argue against the Platonists, but his positive arguments are not preserved. On his likely views see Sharples (1994) 121 n. 119; on the controversy between Aristotelians and Platonists, Boys-Stones (2018) 325–326, 333.

The structure of the chapter is thus a strong diaphonia followed by two compromise views, both closer to the first alternative than the second, but qualifying it in different ways.

d Further Comments

Individual Points

§2 The texts in P and S cannot be reduced to each other. S adds the name-label of Leucippus, but does not read after the name-label Epicurus the words in P *καὶ ὅσοι τὰ ἄτομα εἰσηγούνται καὶ τὸ κενόν*. Laks (forthcoming) suggests that this formula might have been introduced by P to cover up his shortening the list of name-labels and that it might also include the name of Ecphantus, who, as will be revealed in the next doxa, is an atomist (and then would have been left out by S in his list of names to avoid repetition). The difficulty with this suggestion is that it obscures the clear diaeretic structure, in which Ecphantus represents a compromise view between the two views in the diaphonia of §§1–2. A further difficulty occurs in the final phrase of §2. P's words *φύσει δέ τινη ἀλόγῳ* must be in apposition to *προνοίᾳ*, but the retention of the verb *διοικεῖσθαι* is

then rather awkward. So there is something to be said for S's version φύσει δὲ ἀλόγῳ ἐκ τῶν ἀτόμων συνεστῶτα, which describes the composition of the atomist cosmos rather than its administration. But then it might seem otiose that in the next doxa S repeats the phrase ἐκ μὲν τῶν ἀτόμων συνεστάναι. However, A might have done this on purpose to emphasise the partial agreement with the previous position. All in all we now agree with Laks that it is more likely that S preserves the original text in A. There is indeed very little reason why he should have changed it when inserting the material in his anthology. Our text therefore deviates from what we published in our *specimen reconstructionis* at M–R 2.344. We do not, however, agree with Laks' suggestion that Ecphantus might have been included in the list of names in §2. A further point is that the words οὐδέτερα τούτων in S are very similar to G's paraphrase οὐδέτερον τούτων συγχωροῦσι, but this must be a coincidence; cf. M–R 2.344, with which Jas (2018a) 149 is in agreement. See further Runia (2020).

§3 On Ecphantus and the diaeresis with Epicurus see above A 1.3.16–17, where their views are also juxtaposed, and our Commentary ad loc. at section D(d)§§16–17.

§4 The doxa begins with five phrases connected with οὔτε. Only P^B has all five. E, C and S do not have οὔτε μὴν αἰσθητικὸν (G has αἰσθητόν), Q leaves out οὔτε λογικόν. Diels *DG* 16 argued that the former deleted phrase was interpolated. However, the (near) convergence of P^B, G and Q invalidate this conclusion. As Jas (2018a) 154 convincingly argues, the differing texts are the result of haplography caused by the sequence of multiple instances of οὔτε and adjectives ending in -ον. Moreover it is more likely that they were deleted by some sources than that they were added later. For the view that the cosmos as a whole is an οὐσία ἔμψυχος αἰσθητικὴ see the Stoic doxography at D.L. 7.143. The Homeric verse *Il.* 3.277 (= *Od.* 11.109, 12.323) is cited in Arist. fr. 903 Gigon (= Procl. cited by Olymp. in *Phd.* 4.8–9, 85.1–20 Westerink) to show that the heavens have sight and hearing only (the same verse in Ach §5, p. 14.11 and ps.Plut. *Vit.Hom.* 105 is used of the sun). This view is too subtle for the doxographer.

The final phrase of the doxa uses the appropriate Peripatetic (though not Aristotelian) terminology for this question, as is apparent from a text in the *Quaestiones* of Alexander of Aphrodisias(?) (2.21, cited below Section E(b)§4). Alexander argues that according to Aristotle divine providence does occur in relation to mortal beings, but it does so neither κατὰ συμβεβηκός nor προηγουμένως. This position is more subtle than that taken in A, who states that being providentially administered applies to the heavenly bodies, but not to the earthly realm that obtains its ordered state contingently rather than as a primary and direct result of (divine) providential activity. G may have been influenced by such a text when he writes μήτε προηγουμένως μήτε κατὰ συμ-

βεβηχός, but this reading contradicts the earlier part of the doxa and does not make good sense, especially when the phrase τῆς δ' εὐταξίας is omitted.

e Other Evidence

The 'cousin-writing' Ach very briefly states that the cosmos is a living being as part of his chapter on the substance of the heaven. He gives a Platonic doxa that differs from A. It draws attention to the self-moved nature of the cosmos (i.e. explicating that it is ἔμψυχος, though the term νοῦς is used rather than ψυχή). Of course it is possible that a similar doxa was originally present in A if there was a missing chapter on the cosmos' motion; see the Appendix to ch. 2.2. But Ach returns to the narrower tradition when he discusses whether the cosmos requires food a few lines further (see on ch. 2.5).

Commentary

A *Witnesses*

This chapter is unusual in the considerable discrepancies between the two main witnesses P and S. Its reconstruction is therefore difficult and the resultant text more speculative than one would wish.

(1) The tradition of P is well represented with five witnesses. All of them record four doxai except G who has reduced them to three in his usual freer adaptation. In the first doxa P^E has three name-labels (Pythagoras–Plato–Stoics), but Plato is missing in P^{BCQ}. G has Pythagoras and Plato, but combines the Stoics with Epicurus in his second doxa. The first doxa begins by relating that the cosmos is γενητὸς ὑπὸ θεοῦ, which suggests that the subject of the chapter is broader than what the title suggests, i.e. dealing with both the createdness and the indestructibility of the cosmos. As it stands P's chapter gives four coherent options on its subject, but comparison with S shows that the original in A has been reorganized and drastically reduced.

(2) S has divided the lemmata that relate to this subject between his chapters 1.20 and 1.21, combining them with material from A 1.24 and AD. They form four groups:

- (a) S1: 1.20.1c, name-label Plato = second half of lemma 1 in P, treating the cosmos' destructibility only, not whether it is generated.
- (b) S2–9: 1.20.1f = a block of eight doxai including P's lemmata 2–3–4 in places 1–2–8, mainly treating whether the cosmos is destructible or indestructible (but the question of its origin is brought in for the 'eternalist' view).
- (c) S10: 1.21.6c, name-label Pythagoras = first half of lemma 1 in P, describing the cosmos as γενητός κατ' ἐπινόειαν, i.e. discussing whether it is generated.
- (d) S11–13: 1.21.6f = a block of three doxai, of which the first (name-label Heraclitus) is almost identical to the previous one (Pythagoras), i.e. continuing the discussion on whether it is generated.

If these last-mentioned doxai of Pythagoras and Heraclitus are reduced to one, there are 12 doxai in all. As will emerge below, there are good grounds for thinking that one doxa originally present in A was not preserved by S.

(3) T gives a very concise summary of the contents of the chapter through two sets of diaereses. In the first set the doxai of Pythagoras–Heraclitus in S can clearly be recognized in the first alternative, the doxa of Xenophanes in P (with more name-labels in S) less clearly in the second. In the second set the question of the cosmos' destructibility or indestructibility is outlined. The order is thus: γενητός, ἀγέννητος, φθαρτός, ἀφθαρτός. It is surprising that he does not mention the 'mixed' view of Plato (cf. P1 and S1).

B Proximate Tradition and Sources

(1) *Proximate tradition.* The question of the cosmos' generation and destructibility is frequently cited in both rhetorical and philosophical works as a *quaestio generalis* (e.g. Quintilian, Marius Victorinus) or key philosophical topic in the domain of physics (e.g. Philo, Galen, Tertullian). Standard doxographical schemata were developed on the basis of analyses of the question that go back to the Peripatetic tradition as will be discussed below. A fine example is found in the introductory section of Philo's *De aeternitate mundi* (text below; on this text see the detailed analysis in Runia (1981), also (2008b) 35–37 = M–R 3.293–296). It can be summarized as follows (cf. M–R 2.355):

- | | | | | |
|------|----|----|---------------|----------------------|
| (1a) | +A | +B | many kosmoi | Democritus, Epicurus |
| (1b) | | | single cosmos | Stoa |
| (2) | –A | –B | | Aristotle, Ocellus |
| (3) | +A | –B | | Plato, Hesiod, Moses |
- where A = subject to γένεσις, B = subject to φθορά.

This is the same kind of schema that underlies the doxographies in chs. 2.1 and 2.3, where two questions are combined in a grid. Similar doxographies using this schema are found throughout antiquity, with early examples in Varro (preserved by Servius) and Cicero *Luc.* 118–119. Many of these texts must be regarded as proximate to the tradition of the *Placita*; see the listing in section E(a). On the rich continuation of the tradition in Christian texts see the overview by Pépin (1964) 79–100, taking the doxography in Ambrose's *Exameron* as starting-point. Philo adds the distinction between pluralists and unicists (cf. ch. 2.1), which is already implicit in Aristotle and recurs in doxographies in Alexander, Augustine and Simplicius. He has also updated the name-labels so that Democritus is the only remaining Presocratic philosopher. This continues in most subsequent doxographies, unless they are commenting on earlier texts in Aristotle. On the highly interesting schema contained in the recently discovered scholion to Alexander's Commentary on Aristotle's *Physics* see further below at section D(e).

(2) *Sources*. The question of the origin and ultimate destiny of the whole of the physical reality that we experience is one of the key questions of Greek philosophy and its discussion goes back to the very beginnings of the philosophical tradition, as famously stated by Aristotle in his overview in *Met. A.2* 982b12–17 (text below section E(b) General texts). The same author cites it twice as a key dialectical πρόβλημα in the domain of natural philosophy (*Top.* 1.11 104b8, 1.14 105a24) and presents key dialectical-doxographical passages in his *Physics* (8.1 250b11–251a8) and *De caelo* (1.10, 3.1 298b12–299a2) with numerous references to earlier thinkers. These include Plato (*Cael.* 1.10 280a29–32), whose account of the cosmos' genesis in the *Timaeus* (explicit references to the question of whether the cosmos has come into being or not at 27c4–5 and 28b4–7) became a seminal text in the later tradition beginning already with Theophrastus; see the reference to his views in the discussion in the Platonist Taurus recorded by John Philoponus; text below in section E(a) General texts. Philo *Aet.* 117–149 also records four arguments of Theophrastus against those who posit that the cosmos has both a genesis and will perish, which could go back to his Φυσικαὶ δόξαι. This text has excited a vast amount of scholarly discussion; see Sharples (1998b) 131–136, (2008) 57–59; Sedley (1998a). It was also frequently discussed in atomistic sources as a key defining doctrine in their natural philosophy, as can be seen in the remains of Leucippus–Democritus and later Epicurus. See further our remarks above at ch. 2.1 Commentary B and the references to the studies of Furley (1987), Graham (2006) and Sedley (2007).

C Chapter Heading

The heading reveals continuity with the previous chapter. It too has the form of the quaestio, commencing with the conjunction εἰ, and deals with the category of quality. Just as in ch. 2.3, the formulation of the quaestio invites a diaeresis giving a positive and a negative answer, with compromise positions always a possibility. §§2–4 also touch on the question of the cosmos' cause or origin, which will be taken up again in §6.

The heading represents the majority position in the tradition of P. (In S 1.20 it is subsumed under the more general heading taken from A 1.24, Περὶ γενέσεως καὶ φθορᾶς. There is no reference to it in the heading of S 1.21.) A marginal note in a Planudean ms. of P (Ambr. 859) records: εἰ γεννητὸς ὁ κόσμος ἢ ἀγέννητος· εἰ φθαρτὸς ἢ ἄφθαρτος. The scribe has perceived that the title does not cover the chapter's contents well (the same can be said for Ps who gives a less expanded version). The options he uncovers follow the same order as in T. A philosophical treatise by Philo of Alexandria is entitled Περὶ ἀφθαρσίας κόσμου, but in the opening doxography he commences ἄξιον οὖν τοὺς ζητοῦντας εἰ ἀφθαρτος ὁ κόσμος (text below under section E(a) General texts), i.e. exactly the same formulation of the quaestio as in the heading of this chapter. The doxography in the chapter itself covers the questions related to both the cosmos' generation and its destruction, but the treatise focuses mostly on the latter. In the absence of evidence from S, however, the title cannot be considered wholly certain. Like Philo, A may have chosen just one of the four options for his title. But it is possible that he may also have chosen two, e.g. Εἰ γεννητὸς καὶ εἰ ἀφθαρτος ὁ κόσμος. One might compare the title of ch. 5.19 Περὶ ζώων γενέσεως, πῶς ἐγένοντο ζῶα, καὶ εἰ φθαρά. In the absence of further evidence, however, P's title must be retained. We note that a similarly incomplete title is found in the chapter on the indestructibility of the soul at A 4.7.

D Analysis

a Context

The next question to be asked of the cosmos is its origin and its destiny. The question can be asked in terms of time, is it generated and will it come to an end, and in terms of causation, by whom or out of what was it generated, and how or by what will it be destroyed. Both approaches will be taken in this chapter. The question was already raised in the introductory chapter 1.4, Πῶς συνέστηκεν ὁ κόσμος. There is also a clear link with ch. 1.24, Περὶ γενέσεως καὶ φθορᾶς, as *de facto* noted by S. As just noted above, there is also a parallel chapter for living beings as microcosms, ch. 5.19. This chapter refers explicitly to the views of philosophers (without name-labels) on the same questions relating to the cosmos.

b Number–Order of Lemmata

The order of the lemmata in P and S does not correspond, as can be seen in the following table:

P₁ = S₁
 P₂ = S₉
 P₃ = S₃
 P₄ = S₂

Diels in his reconstruction gave priority to the order in P. However, it is very likely that S preserves the order in his two main blocks (see the examples given in M–R 1.226–231). Our reconstruction preserves the order of these two blocks with two exceptions: (i) the Aristotelian doxa at the beginning of the first block (S₂, cf. P₄) seems out of place; (ii) an explanation must be given for the name-label of the Stoics in P₁, which cannot be explained through its occurrence in S₆ as part of the first block.

It is important to recognize, as noted above in section B, that the subject of the chapter is exceedingly common in doxographical texts. Through his knowledge of this tradition P may have been encouraged to deviate from A in his abridgement. The attribution to the Stoics of a view on the cosmos' destructibility that is patently Platonic gives rise to suspicions that P has joined together doxai that were originally separate. It is to be noted that G moves the name-label of the Stoics to the next doxa of Epicurus, which, as the doxographies of Philo and Alexander show, is in fact more accurate (but incomplete since it does not take the difference between multiple kosmoi and a single cosmos into account). This too may have been an initiative of the epitomator based on knowledge of the doxographical tradition (there can no question of G deriving this insight from S).

c Rationale–Structure of Chapter

The structure of the chapter can be understood as follows.

(i) The first doxa presents the view that the cosmos is conceptually, not temporally generated (there does not appear to have been a doxa that it was generated in an unqualified sense). This doxa attributed to Heraclitus is the first of the three doxai in S's second block. As we saw, it should be linked to the Pythagorean doxa cited just a little earlier.

(ii) The next two doxai in S's block move to the question of the cosmos' causal origin. The two views are that it was caused by nature (attributed to the obscure Epidicus; see further under D(d)§3) and by heat and ensoulment (Archelaus). However, there is also a causal view in P's first lemma that the cosmos is γενητὸς

ὕπὸ θεοῦ which is unaccounted for. We propose that it was linked to the name-label of the Stoics preserved by P and represents a third view on the cosmos' causal origin. It is logical to place it first as the overtly theological view, followed by two others that are more 'physical'. P will have combined it with §1 and §9 in our reconstruction. S will have left it out because he thought the views of the Stoa had already been sufficiently accounted for at S 1.20.1e and 1.21.5 (both extracts from AD).

(iii) A then turns to the view that the cosmos is everlasting *a parte ante et post*. S's first block can be integrally taken over, except that its first lemma with the name-label Aristotle (last in P) does not appear to fit in well. It is better left to later in the chapter, where the cosmos' passibility is discussed (S must have seen a link with the cosmic generation and decay taken from 1.24 and AD, and so brought it forward). The assignment of the view that the cosmos has no beginning or end to the Eleatic tradition goes back to Aristotle *Cael.* 3.1 (where only Melissus and Parmenides are mentioned, not Xenophanes), who accuses them of not speaking *φυσικῶς* (text below). In later tradition this view is associated with Aristotle himself; cf. Cic. *Luc.* 119 and Philo *Aet.* 10–11 (but the earlier view is still found at *Prov.* 2.48). The second view in §6 is not given a name-label. The view of an eternal succession of kosmoi is outlined by Aristotle in *Cael.* 1.10 and 3.1 with reference to Empedocles and Heraclitus (texts below). But he does not specify the exact repetition of worlds, a doctrine which later comes to be associated with the Stoa (explicitly in Philo). Von Arnim includes this section as a Stoic fragment in his collection (*SVF* 2.597), but it is far from certain that A had the Stoics in mind, given their reappearance in §8.

(iv) From the fourth doxa in S's block onwards the subject of the cosmos' destructibility is treated, beginning with the unqualified view. As in ch. 2.1, S reveals a lengthy list of Presocratic name-labels which are deleted by P and replaced by the name-label of Epicurus, which he takes over from the final doxa §13. Thereafter there are three views are given in which the destructibility of the cosmos is qualified: Stoics, Plato and then the Aristotelian doxa. The Stoic view is truncated because it does not mention the cyclical nature of the cosmos' destruction (this also occurs in Cic. *Luc.* 119). The Platonic view is presented in the standard Middle Platonist formulation based ultimately on the *Timaeus*. See for example Philo *Aet.* 13, who cites *Tim.* 41a. This interpretation goes back to Aristotle. See further the texts cited in section E below. Aristotle is not given his usual role of defending the cosmos' eternity (cf. Cic. *Luc.* 119, Philo *Aet.* 10–11), but represents a third qualified view, admitting passibility for part of the cosmos (but presumably not the whole).

(v) The last three doxai in S's block treat the cosmos' destruction from the causal viewpoint. Empedocles' view is placed here, rather than with the eter-

nalists (as in Arist. *Cael.* 1.10). Democritus illustrates the atomist viewpoint (hence his name was left out in the list in §7). The final doxa with the name-label Epicurus differs in that it emphasizes the various possibilities of cosmic destruction. On four other occasions Epicurus is placed last with a doxa emphasizing multiple possibilities (which we have called a ‘modal’ view, cf. M–R 2.326): see also chs. 2.2.5, 2.13.15, 2.22.4, 3.15.11. Unlike in these other texts, however, the key term ἐνδέχασθαι is not used. For the divergence of the doxa attributed to Epicurus in P see below D(d)§13.

If this reconstruction is accepted, it emerges that the chapter presents a symmetrical arrangement, as also suggested by T’s very brief summary. It can be summarised as follows (see also the diagram at M–R 2.362):

- A cosmos γενητός
 - 1 with regard to time
 - a but not in time (= §1)
 - 2 with regard to cause
 - a by God (= §2)
 - b by nature (= §3)
 - c by heat/ensoulment (= §4)
- B cosmos αἰδιος
 - 1 unconditionally (= §5)
 - 2 conditionally, i.e. periodically (= §6)
- C cosmos φθαρτός
 - 1 unconditionally (= §7)
 - 2 conditionally
 - a in ἐκπύρωσις (= §8)
 - b φθαρτόν/οὐ φθαρησόμενον (= §9)
 - c partial γένεσις/φθορά (= §10)
 - 3 with regard to cause
 - a through νεῖκος/φιλία (= §11)
 - b through collision (= §12)
 - c through diverse ways (= §13)

The symmetry of the structure is very striking and must surely have been the result of deliberate planning. The result is that the chapter diverges quite markedly from other treatments of the subject. See further our remarks in B above and D(e) below.

d Further Comments

Individual Points

§1 The two formulas at S 1.20.6c & 6f, γενητὸν κατ' ἐπίνοιαν τὸν κόσμον, οὐ κατὰ χρόνον (Pythagoras) and οὐ κατὰ χρόνον εἶναι γενητὸν τὸν κόσμον, ἀλλὰ κατ' ἐπίνοιαν (Heraclitus) amount to the same. Preference is to be given to the former on account of T's evidence. The attribution of the view to Pythagoras can be understood through his connection to the later Platonic tradition, in which the interpretation of Plato's presentation of the genesis of the cosmos was discussed from Aristotle onwards. See the discussion of this text in Burkert (1972) 71, Baltes (1976) 94–96. Both scholars see a significant role for the early Academy (Speusippus, Xenocrates) in this development. The phrase κατ' ἐπίνοιαν occurs in various doxographical texts, including Stob. *Ecl.* 1.11.4, p. 132.10 (Arius Didymus on Aristotle), D.L. 7.135 (Posidonius), Alc. *Did.* 9.1 (Plato). It often introduces a contrast, the precise nature of which is determined by the context. Here the contrast is between 'in thought' and 'in reality' (cf. κατὰ ἀλήθειαν at Proclus in *Tim.* 1.290.7 cited below in section E(b)§1). In Tertullian *Apol.* 11.5 a contrast is made between Pythagoras for whom the cosmos is uncreated and Plato for whom it is created.

The attribution to Heraclitus, on the other hand, is puzzling and runs counter to his usual place in the tradition, as indicated by texts commencing with Arist. *Cael.* 1.10 279b16. Usener's suggestion that the name-label may have been Heraclides is thus understandable but far too risky to be taken over (it is considered plausible by Cherniss 1944, 423 n. 356).

§2 The verb in the conjecture has to remain uncertain. From P the supplement ὑπὸ θεοῦ γενητὸν τὸν κόσμον is possible, but in the light of §§3–4 a verb is to be preferred above an adjective.

§3 The name-label Epidicus is unknown from elsewhere and must be regarded as suspect. But it occurs in Photius' list at *Bibl.* 167 155.35 Henry, so must have been present in his copy of S. This evidence confirms that the reading Ἐπίδικος in ms. F should be preferred above that of Ἐπέδεκτος in ms. P (and Ἐπιδίκτου in the margin).

§4 The doxa has been theologized in the mss. of S. Our text follows Heeren in emending θεοῦ to θερμοῦ. But we do not make the further step of emending to ἐμψυχρίας, as conjectured by Meineke (and initially accepted by Diels and Wachsmuth) because this noun occurs nowhere in Greek literature.

§5 The variants ἀγέννητον/γεννητόν in P^C and S are not so likely in the light of §1.

§7 Of the six name-labels here only one does not occur in the list of thinkers who subscribe to an infinite number of kosmoi in A 2.1.3. But no link is made with that question here. See the comment further below D(e).

It is not impossible that S preserves an additional name-label from this doxa at S 21.2, p. 172.9: Φιλόλαος ἄφθαρτον τὸν κόσμον εἶναι. λέγει γοῦν οὕτως ἐν τῷ Περὶ ψυχῆς κτλ. For this to be the case he must have deleted it when writing out the doxa earlier because he knew he would be citing a text from Philolaus a little later. However, it seems more likely that he writes out Philolaus' view in the standard terminology of this question as an introduction to the text he is about to cite.

§9 We note that at the end of A 1.5.4 in a Platonic doxa on the unicity of the universe, A himself presents the counter argument that the cosmos cannot be ἄφθαρτος because it is γενητός.

§10 This doxa can be linked to Aristotle's doctrine that natural catastrophes only occur in the sublunary realm; cf. *Mete.* 1.14, *Met.* Λ. 8 1074a38–b14, *De philosophia* fr. 8 Ross.

§11 Sturz's conjecture (γίνεσθαι καὶ) φθείρεσθαι must be rejected because he has not taken the structure of the chapter into account. The doxai in this final part of the chapter treat the aspect of destruction only. For other considerations against the conjecture see O'Brien (2000).

§13 There is a considerable divergence between the formulation of the doxa attributed to Epicurus as found in P and in S. In S's block of eight lemmata the doxa follows neatly from the previous one (in fact the words τὸν κόσμον φθείρεσθαι may have been added by S). The text in P, Ἐπικούρος φθαρτόν, ὅτι καὶ γενητόν, ὡς ζῶν ὡς φυτόν, shares only the name-label and the two illustrations. On the basis of its content, which is perfectly acceptable, it would have to be placed after §7. However, a choice has to be made between the two and it would seem much easier to explain how P might have altered the original than how S did it. Because P has drastically reduced this chapter he needed a representative for the destructionist view and the fact that Epicurus held this view was well known. As noted above in section B, this doxography was among the best known in the entire φυσικὸς λόγος. It must be agreed with Bottler (2014) 307, however, that if we are correct, this chapter is a (rare) case where P has not just shortened his original but considerably reworded and restructured it.

e Other Evidence

It would not be difficult in the least to devote an entire monograph to the variations and vicissitudes of this doxography alone, particularly if the links with the related doxographies on the first principles (ch. 1.3), theology (ch. 1.7) and the number and extent of the cosmos (ch. 2.1) are further explored. A's doxography stands squarely within a broad and complex tradition, but also reveals various particular features of its own. We have already mentioned above the symmetrical structure of the chapter. Two further aspects deserve comment.

(1) Unlike Alexander and Simplicius (and to a lesser extent Philo), A does not link up his treatment with the aspect of single and multiple worlds discussed in ch. 2.1. Though not made explicit, the term κόσμος clearly refers to the world we experience. Only the final Epicurean doxa appears to deviate from this (unless the verb φθείρεσθαι in §§12–13 is taken in a future sense).

(2) A striking aspect of the chapter as we have reconstructed it is the inclusion of the aspect of causation for both the cosmos' genesis and its destruction, which looks back to the chapters on principles, cosmology and theology in chs. 1.3–7, but also anticipates the theme of demiurgic creation in 2.6. Brief texts in Quintilian and Galen *PHP* 9.7.9 demonstrate that this aspect was seen as intrinsic to the *quaestio*, as is the aspect of time in other formulations. The theme of causation is also prominent in the Philonic doxography, as we might expect from such a theologically preoccupied thinker. We note that it is also prominent in G's untitled chapter 17, which is not drawn directly from the *Placita* tradition, but shares many themes with it. Here it is the renewed cosmos after the *ecpyrosis* that occurs ὑπὸ τοῦ θεοῦ (p. 609.20 Diels, text below section B(a) General texts).

It is also to be observed that Achilles and the other Aratea do not contain any traces of this doxography, only discussing the ἀρχαί in chs. 1 and 3. This is because the commentator regards Aratus' cosmos as a given and is not concerned with its genesis or possible subsequent fate. One might compare the *De mundo*, but this work does refer to the difference between the supra-lunary and the sub-lunary world (text below section E(b)§10) and clearly assumes the Aristotelian doctrine of the everlasting cosmos.

Of particular interest is the recently discovered fragment from Alexander's Commentary on Aristotle's *Physics* (fr. 539 Rashed) which we have already discussed in relation to A 2.1.2–3; see ch. 2.1 Commentary D(e). The text consists of six different tenets involving both generation and destruction in combination with multiple kosmoi and a single cosmos. It has been thoroughly studied first by its editor Rashed (2011) 488–491 and very recently by Laks (2018). As can be seen from the text cited below in section E(a) General texts, they disagree markedly on its interpretation. Rashed wishes to emend the text in the third, fourth and fifth tenet. Laks shows that these emendations are based on a faulty understanding of its systematics, and argues convincingly that the fourth and fifth belong together as a single view if a second reference to Plato was added. The overlap of Alexander's schema with A's chapter is limited, primarily because it exclusively deals with the combination of generation and destruction, whereas A with the exception of §5 treats them separately (it is closer to, though richer than, Philo's in *Aet.* 7–19). The one Eleatic tenet that they hold in common is in the middle of A 2.4 but occurs at the end of the scholion while

the atomist view of multiple kosmoi begins the scholion's list but in A brings up the rear. Of most interest is the Platonic doxa at §9 where the double formulation (μὲν ... οὐ μὴν) sheds light on the difference between the fourth and fifth tenet—or as Laks argues, tenets 4a and 4b—and is used to justify his conjecture; see (2018) 414, 419. The overlap of name-labels is much greater: only Metrodorus is missing in A, Leucippus and Melissus in Alexander. Ultimately both doxographies derive from Aristotle, but take differing paths.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

- (1) P is attested by the four main witnesses, each recording the same three doxai. G as so often paraphrases, resulting in various alterations.

(2) As in ch. 2.4, S divides the material between his chapters 1.20 and 1.21. His treatment shows some unusual and interesting features.

(a) The Aristotelian doxa is grouped with the doxa from ch. 2.3 in a small cluster at S 1.21.6c.

(b) The Platonic doxa is not copied out, but replaced at S 1.21.1 by a brief summary of this doxa and two others from chs. 2.3 and 2.5a, followed by the quotation of *Tim.* 30a2–c1. Then immediately following at S 1.21.2 he cites the text on which A's doxa in this chapter is based, *Tim.* 33c6–d1.

(c) The Philolaus doxa is cited in both S 1.20 and 1.21, the only time that he copies out a doxa twice (see M–R 1.223, 2.2.369). The reason for this is because its contents relate to the subject-matter of both chapters. The two texts can be compared as follows:

S 1.20.1g, p. 172.6–8

Φιλόλαος διττὴν εἶναι τὴν φθορὰν τοῦ
κόσμου, τὸ μὲν ἐξ οὐρανοῦ πυρὸς ῥυέντος,
τὸ δὲ ἐξ ὕδατος σεληνιακοῦ περιστροφῇ τοῦ
ἀέρος ἀποχυθέντος.

S 1.21.6d, p. 186.24–26

Φιλόλαος ἔφησε τὸ μὲν ἐξ οὐρανοῦ πυρὸς
ῥυέντος, τὸ δὲ ἐξ ὕδατος σεληνιακοῦ περι-
στροφῇ τοῦ ἀέρος ἀποχυθέντος εἶναι τὰς
ἀναθυμιάσεις τροφὰς τοῦ κόσμου.

It is apparent that there is considerable divergence between the text of the two citations. Details will be discussed below in section D(d).

(3) For the first time in his use of Book 2 in CAG Book 4, T does not use the material provided in this chapter.

(4) The evidence in Ach is important for it clearly comes from the same doxographical tradition but is configured differently. He does not devote a separate chapter to this question, but includes it in a chapter entitled Τίς οὐσία οὐρανοῦ (i.e. κόσμου). There are four doxai, i.e. one more than in A: (1) the same as Plato in A but presented anonymously; (2) an anonymous view that the cosmos has an external source of nourishment (this option missing in A, but it recalls the Pythagorean doxa in A 1.18.6); (3) an example of internal nourishment that is reminiscent of the Philolaic doxa in A; (4) the Aristotelian doxa in A, again presented in the form of an argument. We discuss this evidence further below.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The evidence of Ach demonstrates that the subject of this chapter belonged to the proximate tradition on which A depends. However, apart from A and Ach there is very little evidence to show that it was discussed

in a dialectical or doxographical context. We have found no texts in which it is presented as a *quaestio* in the realm of physics.

(2) *Sources*. The absence in the doxographical tradition is surprising given that the question was certainly raised in earlier Greek sources. Plato's emphatically mentions the theme when discussing the body of the cosmos in the *Timaeus*, to which Aristotle may have responded in one of his lost works (see below section D(d)§1). References to the doctrine of exhalations in earlier philosophers, e.g. the attribution to Heraclitus at D.L. 9.9, refer to the (feeding of the) stars and not the cosmos as a whole (on this subject in the context of the treatment of the heavenly bodies Heraclitus is aligned with the Stoa at A 2.17.4). In the background there is also the extensive debate on the Stoic theory of ἐκπύρωσις, in which exhalations play a key role. Plutarch accuses Chrysippus of contradiction in taking over Plato's language of the self-sufficiency of the cosmos and still speaking of the cosmos' growth (as occurs in the ἐκπύρωσις); text below in section E(b)§2, and see also the polemical discussions in Philo *Aet.* 85–103. But the Stoics are conspicuously absent in this chapter. It is also worth noting that, unlike all the chapters in Book 2 so far, there is no reference to philosophers who have a non-teleological conception of the universe. But this is to be expected, since the whole idea of the cosmos feeding itself only makes sense in the teleological framework of the macrocosm–microcosm relation.

C Chapter Heading

This is the first heading in Book 2 that asks the question 'whence' (πόθεν, *unde*). The only previous example was a ch. 1.6. Others will follow at chs. 2.17 (where does light of the stars come from), 4.21, 5.11 and 5.28. On the question *unde* see the note at ch. 1.6 Commentary C. The *quaestio* at 2.17 on the light of the stars implicitly involves nourishment, since light very often entails fire, which needs to be fed; cf. *doxai* at A 2.17.4–6 and our comments *ad loc.* The nourishment of the microcosm is dealt with in Book 5: chs. 5.16 (the embryo) and 5.27 (in general).

The heading is almost wholly undisputed in the main P tradition (the variant in a ms. of P^B is clearly drawn from the Aristotelian *doxa* that immediately follows and the same may have influenced Ps). The exception is Symeon Seth, who changes the title to refer to the heaven because he focusses his attention on the heavenly bodies and adopts the viewpoint that they are only subject to locomotive change and do not undergo the change involved in nourishment.

S refers to the heading in an abridged form in the composite title he devises for his ch. 1.21, Περὶ κόσμου καὶ εἰ ἐμπύχως καὶ προνοίᾳ διοικούμενος καὶ τοῦ ἔχει τὸ ἡγεμονικὸν καὶ πόθεν τρέφεται.

D *Analysis*

a Context

The chapter's theme follows on directly from the theme of ch. 2.3: if the cosmos is a living being, then it must need some kind of nourishment. But the subject discussed in ch. 2.4 adds complications. If it is subject to generation, one may assume nourishment and growth, followed by decline. But if it is everlasting, then nourishment must be combined with a homeostatic equilibrium. The stage is thus set for the answers given in the present chapter. There are parallels with the subject of the source of food for the heavenly bodies, ch. 2.17, and for the microcosm when it starts its life, ch. 5.17 Πῶς τρέφεται τὰ ἔμβρυα.

b Number and Order of Lemmata

There is evidence for only three doxai in the tradition of A and there is no reason to think that these were in a different sequence from that found in P. There may, however, have originally been more lemmata, such as the one preserved by Ach or the one that is obviously missing, on which see the following sub-section.

c Rationale–Structure of Chapter

The first doxa, which unusually takes the form of an argument in the form of a hypothetical syllogism rather than the usual bald assertion, represents the view that the cosmos needs no food at all. The argument is imperfectly expressed. It would be more persuasive to argue that *because* it is everlasting, it therefore needs no nourishment. But this leaves open the possibility that it does have nourishment, but this is internal to itself. This is the second option attributed to Plato and clearly based on *Tim.* 33c4–d1 (esp. c7, αὐτὸ γὰρ ἑαυτῷ τροφήν φθίσιν παρέχον). The third doxa also focuses on internal sources, but this time it is specified as provided by a double source food supply provided through destruction (φθορά), one from heavenly fire, the other from lunar water.

The chapter is thus structured by means of a diaphonia between no nourishment and nourishment, and the latter is divided into two kinds of internal nourishment based on decay, the one general, the other more specified. It is surprising that the possibility of external nourishment is not explored, as occurs in Ach (see below D(e)). If it was originally present in A, it must have not only been epitomized away by P, but also overlooked by S.

d Further Comments

Individual Points

§1 The form of the doxa, starting with the name-label followed by a separate sentence in *oratio recta*, is quite unusual. It is found elsewhere only at

A 1.25.1 (Thales) and 4.8.2 (Epicurus), if we exclude definitions such as at 1.23.1 (Pythagoras and Plato) and 5.3.1 (also Aristotle). It is also unusual to have a compact argument in the form of a syllogism. However, the argument should have been presented: if the cosmos obtains nourishment, it will also be destructible; but it is everlasting, therefore it does not obtain nourishment. Then it would have been logically valid. G impressively avoids the fallacy by paraphrasing the second part and stating that nothing of this kind happens to the cosmos. He thus leaves it to his reader to draw the conclusion that the cosmos does not undergo nourishment.

No argument like this is found in Aristotle's extant works. It is not present in the *De Caelo*, though it might be felt that the arguments against the cosmos's generation and destruction in *Cael.* 1.10–11 prepare the ground for it. The present passage has been claimed for his lost *De philosophia*; see Effe (1970) 19. It is indeed similar to Peripatetic arguments in favour of the eternity of the cosmos in Philo *Aet.* 20–44, which have often been thought ultimately to derive from that work (= fr. 19 Ross). Effe also notes the analogous argument attributed to Critolaus at Philo *Aet.* 74 on the self-sufficiency of the cosmos: it is subject to neither κένωσις or πλήρωσις, both of which are intrinsic to the process of nourishment (despite the explicit attribution to Critolaus, the text is omitted in Wehrli's edition, whose treatment of the entire section *Aet.* 55–75 is unsatisfactory; see further Mansfeld (1979) 186, Sharples (2008) 59–61). However, Effe himself goes far beyond the evidence when he claims: 'Aetios und Kritolaus schöpfen aus dem Aristotelische dialog.'

Aristotle himself has a theory of exhalations in his extant works. It plays a key role in his *Meteorology*, see 1.4 341b6–12 and passim; Wilson (2013) 51–72. They are of two kinds and relate to the sub-lunary world only, so are not discussed in relation to the nourishment of the cosmos as a whole. He is highly critical of predecessors who extend the theory of exhalation to the heavens; see his excursus at *Mete.* 2.2 354b33–355a32.

§2 The doxa's formulation is clearly based on the wording of *Tim.* 33c7–8 αὐτὸ γὰρ ἑαυτῷ τροφήν τὴν ἑαυτοῦ φθίσιν παρέχον. But the phrase κατὰ μεταβολήν is a Peripatetic addition; cf. AD at Stob. *Ecl.* 1.19.1, p. 163.1–2 (not A as printed by Diels *DG* 319 with reservations), where it represents qualitative change.

§3 For this doxa there are three differing versions, P 2.5.3 & S¹ at 1.20.1g and S² in 1.21.6b. On the basis of the evidence it is not easy to determine exactly what stood in A. In determining our text we have benefited from the excellent discussion of Huffman (1993) 261–266. S has clearly adapted his two citations to their anthological context. In general the readings of P and S² are to be preferred. We note the following problematical aspects of the text.

(a) The addition of τοῦ κόσμου at the beginning of S¹ is caused by the anthological context, since he has decided to add the lemma to his citations from chs. 1.24 and 2.4 on genesis and destruction in general and of the cosmos. It is out of place in the present chapter, where φθορά is linked to φθίσις, i.e. as a kind of cosmic digestion. It might also be possible to take τὴν φθορὰν τοῦ κόσμου as meaning ‘the perishing that takes place in the cosmos’. That S took it to mean this might be deduced from the fact that straight after this doxa he writes out another doxa of ‘Philolaus the Pythagorean’ purportedly taken from his work Περὶ ψυχῆς (44A21 DK) which he precedes with the words Φιλόλαος ἀφθαρτον τὸν κόσμον εἶναι. He then quotes a text which ascribes eternity to the cosmos with the same argument found at Philo *Aet.* 20–24 (both Diels ad loc. and Huffman 1993, 343 regard this text as spurious). It is to be agreed with Huffman (1993) 262–265 that Philolaus is best taken to be referring to major cosmic cataclysms, but not to universal destruction such as in the later Stoic doctrine of ἐκπύρωσις, hence supporting the reading of P as against S¹; see also Mansfeld 2020C (n. 27).

(b) It is difficult to choose between τότε μέν ... τότε δέ and τὸ μέν ... τὸ δέ which are about equally represented in the tradition. In the doxographic context, however, an emphasis on classification is more likely than on temporality, so it is best to follow Diels and Huffman and opt for the readings τὸ μέν ... τὸ δέ.

(c) Stylistically it is preferable to have a similar grammatical construction in both the clauses introduced by τὸ μέν ... τὸ δέ (*contra* Huffman). We therefore accept Corsinus’ conjecture ἐξ οὐρανίου πυρός.

(d) The reading περιστροφῇ τοῦ ἀέρος is better attested in the mss. but, as pointed out by Burkert (1983) 242 n. 23, the variant ἀστέρος makes better sense, i.e. the destruction being caused by the revolution of the moon itself as heavenly body. Burkert also claims that the reading of G περὶ τοὺς ἀστέρας ἀποχέομένου supports this preference for ἀστέρος, but this must be considered doubtful. He notes that the doxa appears to formulate in a naïve way the general assumption of early thinkers such as Anaximander, Heraclitus and Empedocles, namely that cosmic destruction occurs through both fire and water, but that there is also a process of self-renewal.

(e) Capelle’s emendation of τούτων to τούτου (cf. *Vors.* 1.404.3) is motivated by the difficulty that fire rushing down from heaven can hardly be an exhalation. Huffman (1993) 265 suggests that, ‘the exhalations need not be directly from heavenly fire and lunar water, but more probably arise from the earth as a result of their destructive effect’, but the formulation remains odd.

e Other Evidence

It is to be agreed with Huffman (1993) 265–266 that the attribution of a theory of exhalations to Philolaus is plausible. As he notes, other Presocratics had developed similar theories: Heraclitus at D.L. 9.9 (= 22A1, from the earth and the sea); Xenophanes at A 2.20.5 (formation of the sun); Hippocrates of Chios at Alex.Aphr. in *Mete.* 38.28–32 (42A6 DK, on the origin of the Milky Way). The doxa is also reminiscent of the theory of periodic natural disasters developed by Plato in *Tim.* 22c–d (note *φοραί* at 22c1), who relates it to ancient myths. As already noted above on §1, the theory of dry and wet exhalations is further developed by Aristotle, but he confines it to the sublunary world and vigorously denies any interaction with the heavenly realm (as in Philolaus). For the connection of the moon with moisture Huffman cites Plutarch *Fac.Lun.* 940A–B, but it is doubtful whether the doxai on Xenophanes at A 2.25.3 and Empedocles A 2.25.6 (cf. also ps.Plu. *Strom.* 10 = 31A30 DK) can help us understand Philolaus' view of the role of air.

The additional doxa in Ach indicating the possible ingestion of nourishment by the cosmos through 'the exhalation that surrounds it' can be linked to the doxa at A 2.9.1 οἱ μὲν ἀπὸ Πυθαγόρου ἐκτὸς εἶναι τοῦ κόσμου κενόν, εἰς δ' ἀναπνεῖ ὁ κόσμος καὶ ἐξ οὗ (cf. also A 1.18.6). The analogy is with a living being who breathes and thus takes in air or πνεῦμα from the outside, which can be regarded as a kind of nourishment. It may have been omitted in A (if indeed it was) because there was already a Pythagorean view via Philolaus. But the omission remains surprising.

E Further Related Texts

Commentary

A Witnesses

The only witness for this chapter is S. Both in the heading of ch. 1.21 and in its contents he records material on the question of the cosmos' ruling part which can come from nowhere else other than A. Diels *DG* 62 rightly observed that P

in the process of epitomization must have skipped a chapter originally present in A. See further M–R 1.186. But he did not wish to introduce a separate chapter in his reconstruction, and so misleadingly placed the material at the end of ch. 2.4. This move was no doubt motivated by the placement of its heading in the title of S 1.21 (see next section). In his apparatus at 333b19, however, he recognizes that it comes after ch. 2.5.

The three doxai at S 1.21.6de, in all of which the term τὸ ἡγεμονικόν occurs, clearly should be assigned to this chapter. We should note, however, that the term and the topic also occur at the beginning of S 1.21, when S gives a summary of Platonic doctrine. It is highly probable that this refers to another doxa in the original chapter, particularly since it covers an important option that is otherwise unrepresented.

There is a parallel chapter for the ἡγεμονικόν of the microcosm and its location at ch. 4.5. Remarkably P also deleted a subsequent chapter on the νοῦς and where it comes from; see below ch. 4.7a.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The reports on the question of the cosmos' ruling part in doxographical texts are more or less confined to reports of divergences in Stoic views: see Cicero *ND* 1.39, *Luc.* 126, Arius Didymus fr. 29 Diels at Eus. *PE* 15.15.7–8 and D.L. 7.139 (texts below section E(a) General texts). The question is then retrospectively applied to the cosmology of Plato's *Timaeus*; see texts in Theon of Smyrna and Proclus cited below in section E(b§1). As in ch. 2.3, the question is not relevant for atomist cosmology.

(2) *Sources.* The question dealt with in this chapter has a double origin. Firstly it follows on from the view that the cosmos is animate and ensouled (cf. ch. 2.3). This allows the analogy between macrocosm and microcosm, which is central to Plato's cosmology in the *Timaeus* and finds its focus especially in the conception of the World Soul. (As we saw, this analogy is also the basis for the question posed in ch. 2.5.) The second step is when the Stoics develop a psychology in which the νοῦς is called τὸ ἡγεμονικόν, and this notion is then also applied to the cosmos; cf. Hahm (1977) 150. The precise location of this cosmic 'ruling part' then became a source of controversy.

Not surprisingly there is no mention of the 'ruling part' in Presocratic texts (except the Philolaus text here, on which see below D(c) below). But the question is raised by Aristotle in a discussion on what is the 'centre' (τὸ μέσον) of the universe, which according to his report the Pythagoreans regarded as the dominant part (τὸ κυριώτατον, *Cael.* 2.13 293b3). This led them to posit their doctrine of a central fire, as outlined in A 2.7.6 (Philolaus). In his own cosmology the Unmoved mover may be regarded as having the role of the 'ruling part'. It

is mentioned A 1.7.23 as the ‘highest god’ and a ‘separate form’, which based on the account in *Met.* Λ.7, but there is no mention of it in *Cael.* and also not here.

C Chapter Heading

The chapter’s heading, missing of course in P’s pinax, can be derived from the heading S gives to 1.21, namely *Περὶ κόσμου καὶ εἰ ἔμψυχος καὶ προνοία διοικούμενος καὶ ποῦ ἔχει τὸ ἡγεμονικὸν καὶ πόθεν τρέφεται* (confirmed by Photius). In reconstructing the title Diels was right to add the words *ὁ κόσμος*, as the formulation of the headings in chs. 2.3–5 show.

This is the only chapter heading to use the formula *ποῦ ἔχει* in asking the question of location. The parallel chapter for the microcosm is A 4.7 *Τί τὸ τῆς ψυχῆς ἡγεμονικὸν καὶ ἐν τίνι ἐστίν*. On headings that use prepositions or phrases to ask questions see ch. 1.1. Commentary C.

D Analysis

a Context

If the cosmos is a living being, as is assumed in the questions asked in chs. 2.3–5 (even if the option that it is not is also taken into account in ch. 2.3), then it is logical to ask where the source of its rational motions is.

The analogy between macrocosm and microcosm, which goes back to Plato’s *Timaeus* and even earlier in Greek philosophy, is crucial to the way the *Placita* are organized (cf. M–R 2.1.40). The same subject is examined in relation to the microcosm at A 4.5 *Τί τὸ τῆς ψυχῆς ἡγεμονικὸν καὶ ἐν τίνι ἐστίν* and 4.21 *Πόθεν αἰσθητικὴ γίνεται ἡ ψυχὴ καὶ τί αὐτῆς τὸ ἡγεμονικόν*.

b Number–Order of Lemmata

It is likely that the Platonic lemma, which gives the most general and commonly held view on the subject, would be presented first. It is equivalent to the view attributed to Chrysippus in the doxographies noted above, in which the ‘ruling part’ is the aether. The other three doxai do not necessarily have to follow the order found in S, because the first (Philolaus) has been clustered with an earlier doxa (A 2.5.3). As the most unusual doxa, it most likely came last. See the next section.

c Rationale–Structure of Chapter

Of the four doxai the first two place the cosmos’ ruling part at the periphery of the cosmos, either in the heaven (aether) or more specifically in the sun. The second two place it in the centre, either in the earth or in the Pythagorean central fire. The chapter thus consists of a main diaeresis, with each of the options again divided into two. In addition there is a movement from the outer peri-

meter to the very centre of the cosmos. In the Philolaic cosmology recorded in the final doxa the central fire is even more central than the earth. However, it is unlikely that the specific statement in terms of a ‘ruling part’ (as distinct from the cosmology that lies behind it) is derived from Philolaus himself. We agree with the conclusion of Huffman (1993) 401: ‘the whole testimonium is not so much a report of Philolaus’ views as a description of the role of the central fire in terms of later philosophical conceptions’.

d Further Comments

Individual Points

§1 As argued above, the Platonic doxa in the summary of doctrine at ch. 1.21.1 replaces the doxa in A. Its wording may be close to what stood in A, but there can be no certainty. We assume that the question asked in the chapter’s heading is understood in the first and subsequent doxai.

Plato nowhere speaks of a cosmic ‘ruling part’, but its existence could be deduced from *Tim.* 36e–37c where the intellective powers of the World Soul are concentrated in the heavens and it is credited with both δόξαι καὶ πίστεις βέβαιοι καὶ ἀληθεῖς and νοῦς ἐπιστήμη τε (37b8–c2). By implication the location of the World Soul is stated to be the heaven in 36e5. An example of how the Stoics equated the soul of the cosmos and its ἡγεμονικόν is found in a quote from Chrysippus in Plu. *SR* 1053B (but it is corporeal in agreement with Stoic materialism); see Reydamas-Schils (1999) 59, who argues that ‘as to corporeality, the *Timaeus* itself has given some impetus to the development of subsequent views on this question’.

§2 It is probable that the verb of saying and the repetition of the chapter’s subject were added by S in accordance with his usual practice (cf. M–R 1.231). If these are removed, the resultant ‘bald’ style is similar to what is found in chapters such as 2.2, 2.22, 2.27, and also tellingly in the parallel chapter on the human ἡγεμονικόν, 4.5.

§3 Here too the additional phraseology will have been added by S. It seems odd, given the assumptions on which the doctrine is based, that the ‘ruling part’ should be ‘in the earth’. But Archedemus may have pointed out that volcanic activity shows that there is fire inside the earth and so at the very centre of the universe. This minor Stoic is not mentioned anywhere else in the *Placita*. The view is reported anonymously by AD at Eus. *PE* 15.15.8, so it is definitely not just made up by A.

§4 The phrase τῆς (or τῇ) τοῦ παντός needs a noun that is missing in the mss. Since it seems that the verb προὔποβάλλω can take either the genitive or the dative it is preferable to retain τῆς as transmitted and supply σφαίρας as the missing noun (with Huffman, *contra* M–R 2.2.379). Remarkably, as Diels *DG* 186 noted,

the same image of the keel of a ship is found in Arist. *Met.* Δ.1 1013a5, where it is followed by the example of the human heart, i.e. the ἡγεμονικόν in later Hellenistic terminology. This will not be a coincidence. The image reappears in ch. 5.17, where the view is attributed to Aristotle that the loins are the first part of the embryo to be formed (5.17.2). See further our discussion there, Commentary B.

e Other Evidence

This brief chapter is an excellent example of how the *Placita* tradition underwent various phases. The general schema of macrocosm and microcosm goes back to early Greek philosophy and exerts an influence on Plato (and also on Aristotle, but more on the structure of his writings than his actual doctrine; see M–R 2.1.40). There is a Stoic overlay which imports some specific Stoic terminology, which is then retroactively applied to Plato and a Pythagorean thinker such as Philolaus. Finally, it is worth noting that the concept of the cosmos' ἡγεμονικόν is absent in Achilles or the Aratea.

§3 A 2.7.3 Ἐμπεδοκλῆς μὴ διὰ παντὸς ἐστῶτας εἶναι μὴδ' ὠρισμένους τοὺς τόπους τῶν στοιχείων, ἀλλὰ πάντα τοὺς ἀλλήλων μεταλαμβάνειν.

§4 A 1.7.22 (de Platone) τούτου δὲ πατρὸς καὶ ποιητοῦ τὰ ἄλλα θεῖα ἔγγονα νοητὰ μὲν (ὃ τε νοητὸς λεγόμενος κόσμος), παραδείγματα δ' ἐστὶ τοῦ ὁρατοῦ κόσμου.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

The evidence for this chapter is solid.

(1) P is again attested by the four main witnesses P^BEGQ, who all record the same six doxai. Ps takes over the title and briefly alludes to the first and third doxai.

(2) S's evidence is less straightforward. Despite its theological and Platonic-sounding title, he seemingly does not find the subject important, not including its title in any of his chapter titles and scattering the doxai, of which he retains

only four, to various locations. The first doxa in P is included as part of a cluster of Stoic views (on the name-label see below section D(d)§1) in S 1.21. The two doxai with the name-label Pythagoras in P are included in another cluster in the same chapter. The first Platonic doxa is included in S 1.22 on the cosmos' τάξις, where it is followed by a quote from *Tim.* 32c5–33a2. But the appended doxa at the end (P6) is left out. The Empedoclean doxa (P3) is also omitted, probably through an oversight. No other material in S is likely to have originated in this chapter.

(3) Ach records differing versions of the first two doxai (the former with the name-label Stoics) and the fifth spread out over chapters on the cosmos' shape and its revolution. For these passages the theme of cosmogenesis is lacking. His earlier chapter §4 Περὶ τῆς συστάσεως τῶν ὄλων contains similar doxographical material, which we shall discuss in relation to A 2.7.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The scattered material in Ach shows that A's chapter had a predecessor in the earlier tradition. There is, however, no further evidence in the proximate tradition. The question is not formulated elsewhere as such and does not appear to have been prominent in the broader doxographical tradition as far as we can tell from the surviving evidence. The parallel texts that we have collected discuss the subject of this chapter, but do not treat it dialectically.

(2) *Sources.* Given the large number of philosophers in the tradition who affirm that the cosmos had an origin (cf. ch. 2.4), it is an obvious question as to how that process of genesis took place. There are various texts in Aristotle (see section E(b) General texts) which refer to the views of earlier philosophers on this question. Implicit in his treatment is a distinction between those who begin the process at the physical level, whether from an earlier state of motion (Empedocles) or one of quietude (Anaxagoras), and those who begin it from higher principles of a non-physical kind (Pythagoreans). This opposition returns in our chapter. On a number of occasions he uses the key term κοσμοποιεῖν, which occurs in the title of A's chapter. We return to this term below in section D(e). In *Cael.* 2.13 more specifically the genesis and place of the earth is discussed. The view that it appeared first returns as the first doxa in A's chapter.

C Chapter Heading

For the heading we have only the tradition in P. (The heading preserved in S^L and recorded at Diels *DG* 271 is drawn from P through contamination, as demonstrated by Elter (1880) 72; cf. Wachsmuth (1882) 74.) E leaves out the word στοιχείου, a not unintelligent move, since §§4–6 do not begin with any

of the elements. The alternative title written in the margin of Ambrosianus 859 is no doubt inspired by the observation that the chapter does not in fact make mention of any creating god. There are reasons for thinking that earlier in the tradition the title may originally have not contained a reference to God, e.g. Ἀπὸ ποίου πρώτου στοιχείου ἤρξατο κοσμοποιεῖσθαι τὰ πάντα, but was altered—i.e. Platonised—by A (or perhaps P); see further section D(e) below. Such a title brings the heading much closer to a parallel chapter for the microcosm (relating to the embryonic living being) ch. 5.17 Τί πρῶτον τελεσιουργεῖται ἐν γαστρὶ. But for an even closer parallel see the alternative title found in table of contents of ms. L, as discussed below in ch. 5.17 Commentary C. See further below section D(e).

D *Analysis*

a Context

The chapter's subject follows on from ch. 2.4: if the cosmos had a genesis, how did this genesis take place? As in previous chapters, there is a rather precisely parallel chapter in relation to the microcosm, but without reference to a creating deity: 5.22 Ἐκ ποίων συνίσταται στοιχείων ἕκαστον τῶν ἐν ἡμῖν γενικῶν μορίων; cf. also ch. 5.23 Πότε καὶ πῶς ἄρχεται ὁ ἄνθρωπος τῆς τελειότητος. The subject of how the cosmos came to be composed has already been discussed at the outset in ch. 1.4, Πῶς συνέστηκεν ὁ κόσμος. The atomist position outlined there is not taken up in the present chapter, which is wholly devoted to teleological versions of cosmogony.

b Number–Order of Lemmata

As far as the evidence goes, P has transmitted the chapter in a complete form. There can be no grounds for altering the order of the doxai.

c Rationale–Structure of Chapter

Five answers are given to the question posed in the title. (a) The first two form a deliberate contrast between genesis starting at the centre of the cosmos and at the periphery. This diaeresis continues a similar opposition in the previous chapter 2.5a. (b) The third lemma gives a variation on the previous one: instead of fire and the fifth element, the process begins with aether, followed by fire and the other elements. The description of the cosmogonic process here giving the view of Empedocles gives more information than is required by the question posed in the chapter's title. It anticipates the long description of the cosmos' structure ascribed to Parmenides in the following chapter, A 2.7.1. (c) The fourth Platonic doxa adds a new aspect by having the process begin with a non-physical entity, the noetic cosmos, followed by soul and body. It is rather

surprising that the demiurgic god of the chapter's title is not mentioned here. (d) The fifth doxa develops the non-physical approach further by taking the incorporeal mathematical realm as starting-point, i.e. the five primary geometrical solids taken again from Plato's *Timaeus* (53c–55c) but attributed in the first instance to Pythagoras. (e) The Platonic provenance is indicated in the final doxa, which is really an appendix to the previous one rather than a separate doxa in its own right.

The first three and the last three doxai can also be seen as presenting a further diaeresis between a physical and a non-physical starting-point for corporeal reality. Such a division is implicit in Aristotle's criticism of philosophers such as the Pythagoreans (and also Plato and his successors) who move from abstract principles to physical bodies in the generation of the cosmos; see for example *Met.* N.3 1091a13–22 (text below section E(b) General texts).

We return to the disconnect between the chapter's theologizing title and the contents of its doxai below in Commentary D(e).

d Further Comments *Individual Points*

§1 The name-label for the first doxa is problematic. P unanimously records οἱ φυσικοί, but S, supported by Ach, places it in a cluster of Stoic doxai. The Stoic name-label is retained by Von Arnim *SVF* 2.582. This can be reconciled with other evidence because for the Stoics, although the process of world-formation does not begin with the earth, it is the first part of the cosmos to be formed (see the comment at M–R 2.123). However, it is also cavalier to dismiss P's reading out of hand. Lachenaud in a note ad loc. observes that it could refer to early Presocratics: doxai such as 12A10 on Anaximander and 13A6 DK on Anaximenes bear the same interpretation, i.e. the earth as the first part of the cosmos to be formed. Moreover the diaphonia of the first two doxai becomes more significant if they represent the two main Diadochai of the early Greek philosophical tradition, as already introduced at A 1.3.1 & 8. Mau in his apparatus testimoniorum appears to suggest that P might have referred to the Stoics under this name-label or included them in it.

So, were it not for the evidence of Ach, it would be tempting to opt for the reading in P and surmise that S added it to the other Stoic doxai because he recognised (perhaps through reading AD) that the doxa was compatible with Stoic doctrine. But the evidence of Ach makes this solution less likely.

A third solution is to retain both in the form οἱ φυσικοί καὶ οἱ Στωικοί. This is what we opted for in our earlier publication (M–R 2.123 n. 266, 2.385–386). At A 1.18.1 the name-label reads οἱ ἀπὸ Θάλεω φυσικοί πάντες μέχρι Πλάτωνος, which G has altered to οἱ ἀπὸ Πυθαγόρου φυσικοί πάντες μέχρι Πλάτωνος (cf. also

οἱ φυσικοὶ in G §18 on the active cause, used to introduce a long list of doxai on a material ἀρχή). For a double name-label with the Stoics in second place joined by καὶ it is possible to adduce an example at A 5.23.1, Ἡράκλειτος καὶ οἱ Στωικοί, but this name-label is of course not strictly parallel. In the present text we have with some hesitation retained this solution, which presumes that S could not easily use the first part in the context of his chapter and that P regarded the reference to the Stoics as sufficient for his purpose.

Bottler (2014) 318 comments on this conundrum: ‘An dieser Stelle zeigt sich die methodische Schwäche der Aëtios-Rekonstruktion: Wenn Stobaios durch Achilles bestätigt wird, dann ist die Ps.Plut. Version erklärungsbedürftig, da Ps.Plutarch lediglich als Epitomator gilt ... Ps.Plutarch hatte entweder eine andere Version vor Augen oder wurde nachträglich bearbeitet.’ It would be more accurate and fairer to say that it demonstrates the difficulties inherent in the reconstruction of the original source of P and S. It is not correct to say that P is only a (mechanical) epitomator. Whenever he manipulates name-labels, as he does frequently, he is more or less creatively intervening in the tradition. The difficulty here is that we cannot obtain certainty about what stood in A, i.e. the texts are ‘irreconcilable’ in the terminology of Runia (2020). But this is only an extreme case of what textual critics face very frequently when they have to judge between divergent readings.

§2 The attribution to Pythagoras of a ‘fifth element’ would appear to be quite anachronistic, since it is a distinctively Aristotelian concept. But here there is no mention of its circular motion and it may well stand for what in the next doxa is called αἰθήρ. On this text Guthrie (1962–1981) 1.272 denies that it is ‘wholly anachronistic’, because he argues for a gradual emergence of the doctrine in early Greek thought, in which Pythagoreanism may have played a role. In addition, from the ps.Platonic *Epinomis* onwards Academics and Platonists toyed with the idea when it suited them. See for example Dillon (1977) 33 (Xenocrates), 169 (Philo), 286 (Alcinous); for a comprehensive treatment of the doctrine’s reception see Moraux (1963), and also below on A 2.7.4–5 Commentary D(d), 2.11.5 Commentary D(d).

§3 The name-label in G, Diocles, is a mistake, perhaps caused by the falling away of some letters, i.e. [Ἐμπε]δοκλής. We note that the doxa carefully distinguishes between elements which are separated out (διακριθῆναι) and cosmic regions which come into being (γενέσθαι). A different approach is shown at D.L. 7.142 on the Stoics: γίνεσθαι δὲ τὸν κόσμον, ὅταν ἐκ πυρὸς ἢ οὐσίας τραπῇ δι’ αἰέρος εἰς ὑγρότητα ...

§4 A neat and compact summary of cosmogenesis in the *Timaeus* as interpreted in Middle Platonism. The second half of the doxa is a very compact précis of *Tim.* 34c4 (note προτέραν) and 31b4–7 (note σωματοειδές) with 32b3–

4. The first half departs further from the Platonic text. The terms ὁρατὸς κόσμος and νοητὸς κόσμος are not found there and are the result of Middle Platonic systematization. Similar terminology is found in A 1.7.22[111–112] and our comments ad loc. at Commentary D(e)§22. These texts represent two of the very earliest instances of the term νοητὸς κόσμος; cf. also Philo *Opif.* 16 and discussion at Runia (1999) 158–160, and also Baltes (1972) 105–106 on Tim.Locr. 30. As we might expect, Philo's account is strongly theologized, whereas in A the demiurge is conspicuous by his absence. A similar but much expanded summary of the *Timaeus* is given by Alcinous *Did.* 13–14. The summary at D.L. 3.71–73—part of what is likely to be quite an early doxographical account—mentions the model (called ὑπόδειγμα) and the four elements, but not the World Soul.

§5 The doctrine attributed to Pythagoras here obviously goes back to Plato's *Timaeus*, but the tradition connecting it to the Pythagorean tradition is ancient, already present in the Old Academy; see Burkert (1972) 70–71 with reference to ps.Iambl. *Theol.Ar.* 82.10–18 (text below section E(b)§5). Diels' attribution of the report to Philolaus in VS and its retention at 44A15 DK is highly questionable; see Huffman (1993) 393. It should also be noted that fr. 44B12 of Philolaus speaks of five elements. If the proposal to read in its final phrase (τ)ὸ τὰς σφαίρας ὄλ{χ}ας is accepted (Mansfeld 2016b), then a reference to the Platonic theory of the five regular solids may be detected, as in A's text, incidentally making it even more probable that the fragment is not authentic.

e Other Evidence

The striking term κοσμοποιεῖν in the chapter heading (but not used in the chapter itself) occurs elsewhere in the *Placita* six times: 1.3.9 (Heraclitus–Hippasus), 1.7.5 (Archelaus), 1.7.6 (Anaxagoras), 1.24.2 (Empedocles and other corporealists), 1.25.3 (Parmenides–Democritus), 2.13.14 (Orphic writings). We note that in the first of these texts it is said that 'all things originate from fire and all things terminate in fire; and when it is quenched, all things are formed into the cosmos (κοσμοποιεῖσθαι τὰ πάντα); first its densest part is concentrated and becomes earth; then the earth is loosened by fire and naturally produces water, which (in turn) evaporates and become air'. This is precisely the subject of our chapter and similar to the Stoic view discussed above in section D(d) §1.

It should further be noted that the term itself goes back to Aristotle, who uses it on four occasions not of a deity or another efficient cause, but for philosophers who put forward cosmogonic theories; texts below at section E(b). In particular the words at *Cael.* 3.2 301a13, where it is said of Anaxagoras ἐξ ἀκινήτων γὰρ ἄρχεται κοσμοποιεῖν, are reminiscent of the heading of the present chapter. (On the importance of the term in Aristotle's treatment of his cosmological predecessors see Johnson 2019, 74, 107.) Against this background, and

taking into account the fact that there is no reference to a creating deity in the body of the chapter, it might be surmised that in the earlier tradition the title was Ἀπὸ ποίου πρώτου στοιχείου ἤρξατο κοσμοποιεῖσθαι τὰ πάντα. As noted above in section C, this would bring it closer to the parallel heading of ch. 5.17 and esp. the alternative title in S^L. The current heading is exceptional because it goes against the grain of what we have called the ‘detheologizing tendency’ of the *Placita*; see Mansfeld (2013a) 330–331.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

(1) The P tradition is again represented by the four main witnesses. In P^{BEQ} there are the same six doxai. G has radically shortened the chapter, preserving only two lemmata, of which the former as transmitted is a combination of the Parmenidean and Platonic doxai. This is clearly meant to represent the standard cosmology where elements have their fixed place, which is then followed by the final Empedoclean lemma in which the elements do not have a fixed

place. So in spite of his brevity G still uses the diaeresis which is the hallmark of the method of the *Placita*!

(2) The chapter's contents become more complex when the evidence of S is taken into account. Five of P's six lemmata are found. The location of P6 = S1 (Empedocles) in S 1.15 Περί σχημάτων is surprising: it seems that after quoting the first doxa of A 2.8 (Diogenes–Anaxagoras), before writing out the second, Empedoclean doxa in that chapter, the anthologist decided first to write out the previous final doxa (as we believe) in A 2.7. Presumably he marked his text, because he does not repeat this doxa when he writes out the others in S 1.22.

The evidence in S 1.22 is complicated. It can be analysed as follows. (a) He uses A's title for his chapter. (b) He then begins by presenting P1 = S2 (Parmenides) in a much longer version, which in all likelihood is the original prior to P's excision of its latter part. (c) It is followed by S3 = P5 (Aristotle), whose mention of αἰθήρ links up well with the conclusion of the first doxa. But here he copies out on the first part of the doxa and replaces the rest with an extract from AD. The Platonic doxa P4 is thus left out (it is replaced by material from A 2.6). (d) He follows (= S4) with a long account of Philolaus' cosmology missing in P, but certainly belonging to this chapter (note how it is linked up with the AD quote through the role of τὸ μέσον). (e) Finally he writes out the two atomist doxai P2–3 = S5–6, followed by the inserted Platonic material.

(3) T again passes over this chapter, no doubt because it does not illustrate the diaphonia of the philosophers sufficiently clearly.

(4) A small amount of parallel material is found in Ach in his §4 Περί τῆς συστάσεως τῶν ὄλων. On Ach's evidence see further below section D(e).

B Proximate Tradition and Sources

(1) *Proximate tradition.* Various parallels show that the chapter's contents share common elements with earlier doxographic traditions. For the account of Parmenides' cosmology there is a briefer parallel text in Cicero's theological doxography at *ND* 1.28; we return to this text below at D(d)§1. The doxa of Leucippus and Democritus shares the interesting feature of a membrane holding together the contents of the cosmos with the atomist account of its origin in D.L. 9.32. In the case of Epicurus' doxa it is possible that we have its direct source in *Ep.Pyth.* at D.L. 10.88; we return to this text too below at D(d)§3. The Philolaus doxa shares some features with Aristotle's discussion of the early Pythagoreans in *Cael.* 2.13, but it is difficult to determine where much of its unparalleled content derives from (see the discussion at Huffman 1993, 395–400).

In general, descriptions of the cosmos' final structure are not a common feature in doxographies of individual philosophers in the proximate tradition such as we find Diogenes Laertius and Hippolytus. The emphasis there is on the ele-

ments as principles (or derived from them) and on descriptions of the genesis of the cosmos. See for example ps.Plutarch *Strom.* 5 on Parmenides (text section E(a)§1 below). Another example is the very brief account of the cosmos in Hippolytus' doxography on Plato (text section E(a)§4 below), which follows the reference to matter as one of the three principles. The four elements there follow the *Timaeus* and differ from the five elements in the present chapter.

(2) *Sources.* The contents of the chapter, which record Presocratic views on the structure of the cosmos of varying length (§§1,2,6,7, i.e. two long and two short), is clearly based on original sources, as is evident in the Parmenides doxa with its reference to the δαίμων in fr. 28B12 DK. But it is not likely that it occurred at first hand. These summaries most likely go back to the Peripatos, possibly but by no means necessarily going back at least in part to the labours of Theophrastus. The brief summary of Plato's cosmology is not directly based on the *Timaeus* and perhaps shows Academic features.

The Aristotelian cosmology lacks the theology of A 1.7.23 and, though very brief, describes the sub-lunary elements. There is little verbal resemblance to the extended description of the Aristotelian universe in the *De mundo*.

C Chapter Heading

After a number of chapters with different kinds of headings, the heading here returns to the common umbrella type Περί x and is paralleled at ch. 2.15 Περί τάξεως ἀστέρων. The quaestio is in the category of relative position (category of place, ποῦ). Ach has a chapter with a parallel heading, Περί τῆς συστάσεως τῶν ὄλων, where σύστασις means 'composition'; cf. the regular use of σύστημα in definitions of the cosmos, e.g. at ps.Arist. *Mu.* 2 392b9 (Aristotle), D.L. 7.138 (Stoa). There is no parallel chapter for the microcosm. Ch. 5.22, with the heading Ἐκ ποίων συνίσταται στοιχείων ἕκαστον τῶν ἐν ἡμῖν γενικῶν μορίων, asks a different question, i.e. quality rather than relative place.

Two of the mss. of P^B support the shorter version of the title, Περί τάξεως κόσμου, parallel to the titles of chs. 2.1–2 and 2.15. But the longer version with τοῦ κόσμου is found in E and G, and is also supported by S, so it must be retained.

D Analysis

a Context

After the (limited) discussion of cosmogonic processes has been set out in ch. 2.6, attention now turns to the result of that process, i.e. the structure of the physical world as it now exists. The subject is parallel to that of ch. 2.15, Περί τάξεως ἀστέρων, which goes into further detail on the arrangement of the heavenly bodies. The similarity lies in the notion of the ordering of separate elements. As we just saw, the chapter thus falls under the Aristotelian category of

(relative) position (κεῖσθαι). Ch. 2.12 Περί ἐγκλίσεως γῆς may be seen as another parallel, but there is no equivalent chapter for the microcosm or the animal realm.

b Number–Order of Lemmata

The evidence points to seven doxai, all but one at least partially present in P. Nothing in S contradicts the order found in P. But the doxa of Philolaus deleted by P must be given a place. Diels placed it at the end. This position is not persuasive, however, if the chapter's structure is taken into account.

c Rationale–Structure of Chapter

The final place of the Empedoclean doxa in the chapter should be preserved. As already observed on G's abridgement of the chapter (see above section A(1)), the main diaeresis in the chapter is between the cosmologies in which the elements have a fixed location and the view attributed to Empedocles that they are not fixed. This final position is often taken by doxai of Epicurus in other chapters (e.g. chs. 2.2, 2.13 etc.) It is more difficult to determine the rationale for the remaining six doxai. The first doxa is very long by the standards of the *Placita*. Its first half gives a highly exotic Presocratic cosmology that bears little relation to the standard cosmological model that by A's time was wholly dominant. The second half reads much more conventionally with references to the elements and various heavenly bodies. Each half has its own causative factors, the former formulated in theological terms, the latter emphasizing the role of condensation and exhalation. The next two lemmata P2–3 = S5–6 are much briefer and link up with Parmenides' view of the solidity of the extreme limit of the cosmos. The atomists differ by having a thin membrane around the cosmos, while Epicurus represents a compromise view in which both possibilities are entertained.

The Platonic and Aristotelian doxai P4–5 (= S3 only) more closely approximate the standard cosmological model and are clearly formulated in such a way as to form a contrasting pair, the key difference being the role of aether. It is possible that the Platonic doxa was originally longer, since we cannot draw on S to check what P did with it. There remains the doxa of Philolaus (= S4), who as in chs. 2.5 and 2.5a is seen as having a distinctive cosmological doctrine. The doxa is even longer than that of Parmenides and can also be divided in two parts. The first gives the distinctive cosmic order reported by Aristotle in *Cael.* 2.13 (see also A 3.11.3). The second divides the cosmos into three regions each with their own distinctive names. Both Burkert (1972) 243–246 and Huffman (1993) 395–400 regard this second part as inauthentic. The doxa will have to be placed either before the Plato–Aristotle pair or after it (not in the final place, as

done by Diels, for reasons given above). The cosmology of the first part, apart from the distinctive doctrines of the central fire and the counter-earth, is reasonably similar to the Platonic and Aristotelian views. So the doxa could come in between Epicurus and Plato as a transitional view. But it seems more probable that it follows the Platonic-Aristotelian pair, with the start of the doxa πῦρ ἐν μέσῳ περὶ τὸ κέντρον placed in deliberate contrast to Plato's view which starts with fire at the periphery. The contrast between centre and periphery recalls the similar diaeresis in ch. 2.6. It might further be argued that the three doxai stand as rational–teleological views in implicit contrast to the mechanistic–atomistic emphasis of the first three (in the case of Parmenides especially the second half). This antithesis has been recognized as fundamental to the development of early Greek cosmology; see Furley (1987), Sedley (2007), and also our comments above at chs. 2.1 Commentary B and 2.4 Commentary B.

d Further Comments

Individual Points

§1 This account is an important witness to Parmenides' cosmology because it is presumably derived from his poem, but we do not possess the lines on which it is primarily based. There are two significant parallel texts which place more emphasis on the theological aspects of the cosmos' genesis and structure than A does. Cicero *ND* 1.28 specifically mentions the role of 'something resembling a crown which he gives the name στεφάνη, a continuous circle of glowing lights'. The term στεφάνη occurs in lines 1 and 5 of A's doxa. The earlier text of Philodemus *Piet.* col. 324 Vassallo (= fr. 13 Schober) is very fragmentary and appears to show less resemblance to A's text; it is partly cited on ch. 1.7 section E(a)§17. For a detailed comparison of all three texts see now Vassallo (2016b). Further discussions of the cosmology latent in A's text in Morrison (1955) 60–61; Guthrie (1962–1981) 2.61–63; Tarán (1965) 232–250; Finkelberg (1986). On Diels' interpretation of the text as an excerpt from Theophrastus see Mansfeld (2011c), 395–396, who concludes (396): 'The derivational hypothesis of the *DG* tends to confirm itself'.

§1[6–7] The text here must remain uncertain. We print Diels' text at *VS* 1.114 (also in *DK*), which takes its cue from conjectures by Krische and Wachsmuth. It retains the conjunction τε καί and so must find two nouns, which it draws from Simplicius in *Phys.* 34.14–16 καὶ ποιητικὸν αἴτιον ἑκείνος (sc. Παρμενίδης) μὲν ἐν κοινὸν τὴν ἐν μέσῳ πάντων ἰδρυμένην καὶ πάσης γενέσεως αἰτίαν δαίμονα τίθησιν (but note that there is no reference to ἀρχή in this passage). The other strategy is to emend τε καί, as Diels for example did in *DG* by taking over Davis' conjecture τοκέα. For want of better, the commentators generally accept the text in *DK* (also Mansfeld-Primavesi fr. 14; but Laks–Most fr. D15 vol. 5 p. 58 obelize the original text).

§1[8] The emendation to *κληδοῦχον* accepted by most editors is based on the reference to Justice holding the ‘alternating keys (*κληῖδας*)’ in l. 14 of the Proœmium (28B1). But the text in S *κληροῦχον*, ‘holder of the lots’, also makes excellent sense, as observed by Guthrie (1962–1981) 2.62, who refers to the role of Lachesis in Plato’s myth of Er (*Resp.* 617e). It is retained by Mansfeld–Primavesi and Laks–Most in their recent editions.

§3 As noted in section B above, we may have the source of this doxa in Epicurus’ *Letter to Pythocles* preserved at D.L. 10.88 (and also perhaps the mother work *On nature* on which it is based). The doxographer has simplified the text by deleting the reference to multiple possibility based on lack of sensory evidence. The mention of multiple kosmoi places the doxa outside the scope of the chapter in the strict sense, but allows the contrast with the previous view. The juxtaposition of the early Atomists and Epicurus is parallel to what we find in A 2.2.4–5.

§§4–5 Both doxai have five elements, but in different configurations. There is no text in the *Timaeus* from which the former doxa can easily be derived. At *Tim.* 58d αἰθήρ is regarded as a form of air. In *Epin.* 984b aether follows fire. Xenocrates, however, in his life of Plato as cited by Simplicius relates αἰθήρ and the four elements to the five perfect geometrical figures of *Tim.* 53–55 and his view may be reflected in this doxa (text below section E(b)§4). Whether Plato espoused a four- or five-element cosmology was a matter of dispute in Middle Platonism, no doubt due to Aristotelian and Stoic influence; see the comments of Dillon (1977) 49. At Alcinous *Did.* 15.4 αἰθήρ seems to replace fire as the substance of the heavenly bodies rather than be placed next to it as in A. On the expression πέμπτον σῶμα see further A 2.11 Commentary D(d)§5.

§6 As noted above in section D(c), Burkert and Huffman regard the first part as based on authentic material (particularly fr. 7 preserved by S at 1.21.8), but argue that the second part contains elements that are contradictory to the system described in the first half and so should not be regarded as genuine. The doxa is extraordinarily long for the *Placita*, no doubt reflecting an earlier more expansive phase of the tradition. The epistemological turn at the end is remarkable.

§6[29] Huffman omits <πέν>τε (or ε’) in his text, presumably because he thinks two references to five planets in a single doxa is unlikely. The likelihood is increased if the doxa itself is composite. See further on the Democritus lemma at ch. 2.15.3.

§7 The doxa appears to go back to a criticism that Aristotle brings against Empedocles that his elements do not move in fixed directions but change their direction of movement (and their location?) through chance: see *Phys.* 2.4 196a19–23, *GC* 2.6 334a1–5 (where the lines 31B53 & 54 DK are cited) and a brief discussion in O’Brien (1969) 147–148.

e Other Evidence

The evidence in Ach is intriguing. The final doxa with the name-label Empedocles is parallel to the final doxa in A, though presented in a slightly longer and clearer form. He adds an illustration missing in A involving earth and fire (the same elements as in Aristotle *GC* 2.6 333b28 & 31). The doxa clearly comes from the same tradition as A. Other doxai differ, with different name-labels. The reference to the Aristotelian cosmos is only used to explicate the Orphic doctrine. This lengthy doxa compares the structure of the cosmos to an egg. Nevertheless its treatment of the parts of the cosmos is reminiscent of the content and method of this chapter. It may have come from the earlier doxographical tradition used by A; see ch. 2.2 Commentary D(e). There is no parallel in A for the doxa on Xenophanes with a quote from his poem.

μὴν τῆς γῆς οὐκ οἰκουμένην ὑφ' ἡμῶν, καὶ οὕτως ὥσπερ κενεμβατοῦντα ἐκλείψιν ὑποφαίνειν. ὁ δ' αὐτὸς τὸν ἡλίον εἰς ἄπειρον μὲν προιέναι, δοκεῖν δὲ κυκλεῖσθαι διὰ τὴν ἀπόστασιν. A 3.14.1 Πυθαγόρας τὴν γῆν ἀναλόγως τῇ τοῦ παντὸς οὐρα-
νοῦ σφαίρᾳ διηρησθαι εἰς πέντε ζώνας, ἀρκτικὴν ἀνταρκτικὴν θερινὴν χειμερινὴν ἰσημερινήν, ὧν ἡ μέση (τῆς θερινῆς καὶ χειμερινῆς) τὸ μέσον τῆς γῆς ὀρίζει, παρ' αὐτὸ τοῦτο διακεκαυμένη καλουμένη· ἡ δ' οἰκητὴ ἐστὶν ἡ {μέση τῆς θερινῆς καὶ χειμερινῆς} {θερινῆς}, εὐκρατὸς τις οὖσα.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

(1) In the P tradition the chapter is again well-attested, with all four main witnesses retaining it and recording just the two doxai. G has paraphrased away

very little, though he leaves out the important final phrase of P2. Q leaves out a number of phrases. Ps remarkably includes this chapter's title and uses it as an opportunity to express surprise at the wayward ideas of philosophers who do not understand the cosmos' structure (he uses some words from the text to paraphrase their views).

(2) Both lemmata are copied out by S close together in 1.15 Περὶ σχημάτων. The former (Diogenes–Anaxagoras = S1) follows doxai on the cosmos' shape (see A 2.2); the latter (Empedocles = S2) is the second doxa in a cluster of three combining doxai from A 2.7, 8 & 10. This has the effect of separating the two doxai which are clearly meant as a contrasting pair.

(3) There is no trace of this chapter in T or any other related doxographical texts. Ach has a chapter entitled Εἰ ἔστηκεν ὁ κόσμος (§9). But it discusses Stoic and Epicurean cosmology, in which the cosmos is surrounded by the void, and does not touch on Presocratic cosmogonic theories. On the mention of κλίματα in §19 see section D(e) below.

B Proximate Tradition and Sources

(1) *Proximate tradition.* There are faint traces of the same topic in individual doxographies of Presocratic philosophers: cf. D.L. 2.9 (Anaxagoras), Hippolytus *Ref.* 1.9 (Archelaus); texts cited in section E(a) below. It is likely, therefore, that the subject was included in the earlier doxographical tradition. It is noteworthy that the opening scene of the ps.Platonic *Erastai* appears to allude to a dispute on this topic. The philosophers mentioned are Anaxagoras (as in this chapter and also at D.L. 2.9) and Oenopides (also mentioned on the zodiac inclination at A 2.12.2). If this work is to be dated to the early Hellenistic period (cf. Erler 2007, 297), it may reflect early doxographical summaries. Perhaps it is meant to reflect the preoccupations of an earlier time.

(2) *Sources.* The evidence of our chapter shows that its subject was discussed in Presocratic texts. But it receives no attention in later sources such as Aristotle's *De caelo*, no doubt because such speculations lost relevance when the vortex model fell out of favour and the standard cosmological model became dominant in the fourth cent. BCE; on this controversy between two cosmological paradigms see Furlley (1987) 160–161, 193.

C Chapter Heading

The quaestio posed by the chapter, like its predecessor, falls under the category of position (κρίσθαι). However, the formulation of the heading clearly indicates that the chapter also poses the question of the cause. Though there are a number of chapter headings inquiring about the cause(s) of phenomena (cf. 5.9, 14, 18, all starting with Διὰ τί) and many starting with Πῶς (e.g. 1.4, 4.11, 5.6–

8 etc.), this is the only one using the formulation *Τίς ἡ αἰτία*. Some mss. of P^B have a longer heading commencing with *Περὶ τοῦ* (also found in the index at the beginning of the Book), but the combined weight of P^{EGQ} weighs against it. S does not refer to the chapter heading. Diels *DG* 337 erroneously thinks it formed part of his ch. 1.22 (and so prints it at 337.25). But the very long chapter heading drawn from the Laurentianus ms. (see Wachsmuth 1882, 32, 74) which he prints at *DG* 271 is patently contaminated from P; see above on ch. 2.6 Commentary C. and further M–R 1.267.

D *Analysis*

a Context

The purported tilt of the cosmos is a sub-topic of the theme of the cosmos' *τάξις* discussed in the previous chapter and is somewhat surprisingly appended to it as a separate chapter. But it is important to note that there is a chapter in Book 3 on the subject of the earth's tilt, 3.12 *Περὶ ἐγκλίσεως γῆς*. This parallelism will have appealed to our doxographer and may have even motivated its inclusion. In fact the focus on the earth's tilt occurs in this chapter as well. Both chapters (as also chs. 2.7, 3.11) can be subsumed under the Aristotelian category of 'being in a certain position' (*κεῖσθαι*). We should note, however, that the explanations given relate to cosmogony (i.e. ch. 2.6) rather than cosmology (ch. 2.7).

b Number–Order of Lemmata

There is no evidence that points to the chapter having any more than the two doxai preserved by the two main witnesses. The extent of the doxai in these witnesses also coincides, so it seems likely that exceptionally P simply wrote out what he found in A in full. The order is also hardly in doubt, given that S confirms P on this aspect too.

c Rationale–Structure of Chapter

The problem raised in this chapter is not raised by the standard Platonic–Aristotelian cosmological model that became dominant in antiquity from the fourth cent. BCE onwards. In this model both the celestial and the earthly pole are on the same axis and neither the cosmos nor the earth are tilted. But not all ancient cosmologies posited a spherical earth and a spherical cosmos. Since the celestial North Pole does not appear directly overhead to an observer on earth, the question can be asked why the heaven is tilted in relation to the earth and the earth in relation to the heaven. The cosmologies in this chapter (and in its parallel ch. 3.12) antedate the standard model. Both appear to assume a flat or cylindrical earth (cf. the options in ch. 3.10). It would appear that the account assumes that both the earth and the cosmos are tilted (cf. also ch. 3.12 focused

on the earth). We shall not enter into the details of the cosmology involved. See the discussion at Couprie (2011) 69–78, (2018) 27–28, who argues that in recording both here and in ch. 3.12 a dip of the earth the doxographers misunderstood the original theories which posited only a tilting of the heavens to the north (and not the south).

Since there are only two doxai (infrequent in the *Placita* when the evidence of S is available, but cf. chs. 1.20, 2.10, 2.12, 2.18, 4.7a, 4.17), they can either be a list of random views or form an antithesis. In the light of A's general practice the latter is much more likely. The first doxa attributed to Diogenes of Apollonia and Anaxagoras in effect gives a cause that is no cause. The tilt happens 'somehow of its own accord' or spontaneously. The further comment ἴσως ὑπὸ προνοίας is best seen as an addition by the doxographer or his tradition under the influence of Stoic philosophy (cf. Laks 2008, 215). One might compare the discussion in Philo *Prov.* 2.60 between Alexander defending a mechanistic view of cosmology and Philo arguing that cosmic order is the result of divine providence; see text cited at A 2.6 section E(a) General texts. The suggestion introduces a teleological element into the explanation which can explain why some parts of the earth are habitable and others not. The Empedoclean doxa in contrast gives a specific cause—air yielding to the onrush of the sun—, which must be seen as a purely mechanical cause involving elemental movement (cf. A 2.7.7). The antithesis can thus be interpreted as a division between a second-order (or non-physical) cause (whether chance or providence) and a physical–mechanistic cause; cf. M–R 2.2.412. It cannot be agreed with Bottler (2014) 335 that the contents of the first doxa do not correspond to the search for a cause as indicated in the title, but (only) intend to explain the habitability of the world. The cause of spontaneous occurrence is given and then a teleological aspect is added.

d Further Comments

Individual Points

§1 Laks (2008) 216 points out that the term κόσμος in the phrase μέρη τοῦ κόσμου is not used loosely for the earth, but reflects the projection of the zones of the earth on the cosmos as a whole; see the doxa attributed to Pythagoras at A 3.14.1.

§2 In the final clause the reading of P^B, κατὰ ψύξιν καὶ ἐκπύρωσιν καὶ εὐκρασίαν, links up with ἀοίκητα (too cold or too hot) and οἰκητά (in between). E has reversed the last two nouns so that the sequence reflects the sequence on earth from north to south. The preference should be given to P^B.

e Other Evidence

Ach in his chapter on the sun (§19) in an aside explains that the term κλίματα (latitude, region) refers to high and low points of the earth's surface resulting in differing habitations of nations. This explanation differs from what is found in the current chapter, but does bring to mind the odd doxa on the eclipses of sun and moon attributed to Xenophanes at A. 2.24.8.

Commentary

A *Witnesses*

(1) The attestation of the chapter in the P tradition is the same as in the previous three chapters, with all the four main witnesses available. For this chapter, however, the divergences between them are greater than usual.

(a) The most straightforward text is presented by E with four doxai.

(b) Q's text appears to be rather similar, but with a slightly longer version of the fourth lemma as found in P^E.

(c) The transmitted text of G is extremely problematic and is of no use for reconstructing the text of A. There are three doxai, of which the first and third doxai correspond to the first and last in P^E, but with—it seems—imperfectly preserved name-labels. The second links the Stoic doxa to the first with reference to cosmic 'inbreathing'. Jas (2018a) 165 rightly follows Nicolaus in leaving out the final phrase of the third lemma present in all the Greek manuscripts. It has obviously been misplaced.

(d) The mss. of P^B deviate from E's text by splitting up the fourth lemma with separate doxai for Aristotle and Plato. Instead of the name-label Πλάτων Ἀριστοτέλης as in P^{EQ} the transmitted text reads ἐν τῷ πρώτῳ Περὶ κενοῦ Ἀριστοτέλης ἔλεγεν εἶναι κενὸν Πλάτων μήτ' ἐκτὸς τοῦ κόσμου μήτ' ἐντὸς μηδὲν εἶναι κενόν. There has been much discussion on this text. Should the reference to a work *On the void* go with the previous Posidonian doxa or is it a mistaken reference to Aristotle's *De caelo*? The most elegant solution is to see the comment as a marginal gloss pointing out that in Book I of A (not Aristotle), i.e. 1.18.6, the epitomator (wrongly) credits Aristotle with this view; see further A 1.18 above and M–R 2.2.416–418 (we revise our earlier suggestion reported by Algra 1993, 480). Once these words are excised P^B reduces to a text very similar to P^{EQ}, though with some minor variations. Diels and Lachenaud sensibly emend the text in conformity with P^E. Mau retains the separate doxai for Plato and Aristotle. This is a striking example of the methodological deficiencies of his edition.

(2) S coalesces this chapter with A 1.18–20 in his chapter 18 Περὶ κενοῦ καὶ τόπου καὶ χώρας. He records the same four doxai as P, the first three in a block (= S1–3), the fourth (= S4) in a small cluster with A 1.19.1 followed by a quote from *Tim.* 32c–33c. In the process the Aristotelian name-label in P4 is dropped.

(3) T does not exploit this chapter, having cited extensively from the parallel chapter 1.18 at CAG 4.14.

(4) The two texts in Ach. ch. 8 and *Commentaria in Aratum* I §3 share so many characteristics with A that they must belong to the same doxographical tradi-

tion. Both texts use the method of the diaeresis. Both refer to the atomist view of an infinite void populated by infinite kosmoi, which A must have left out (but did include in 1.18). In addition the Stoic view is prominent in both and there are overlaps in vocabulary. The texts are of limited use for the reconstruction of the text, but of great interest for its larger context.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* There can be no doubt that the subject of this chapter was regarded as a standard quaestio in the domain of the φυσικός λόγος, for A himself gives it as an example in the preface to his compendium (text above *Loci Aëtiani*). A very similar formulation is found in *Commentaria in Aratum* I ch. 3 (note that ζήτησις corresponds to ζητεῖ and ζητεῖται in A). The quaestio is mentioned in numerous texts drawing on the proximate tradition (see the listings below in section E(a) General texts), some of which are of considerable interest. We note first Galen *PHP* 9.6.21–22, who gives it as an example of where philosophers disagree and provides the basic positions of the diaeresis without name-labels (a discussion of this text is given at M–R 3.69). Even more interesting perhaps is the version in the recently discovered Archimedes palimpsest already discussed at ch. 1.18. Here four logically possible positions are distinguished (κατὰ διαίρεσιν) as follows (text below section E(a) General texts):

- question: is there a void inside or outside the cosmos?
- position I there a void both inside and outside.
- position II there is neither a void inside nor outside.
- position III there is a void outside, but not inside.
- position IV there is a void inside, but no void outside.

Representatives of each position appear to be given, although the text is defective and it must be surmised that the Stoics represented the third view. The method here is reminiscent of A's approach in chs. 2.1, 2.3 and 2.4. In each case a *quaestio* with two parts allows a matrix of four views. In this particular case all four positions can be represented and if we take chs. 1.18 and 2.9 together each of them occurs in A with very similar name-labels. See further discussion in Mansfeld (2014), and also below section D(e). In *Pecc.Dig.* 7.8–9 Galen probably has similar doxographical material in mind when he opposes and aligns together three different views (Academic, Stoic, Epicurean), concluding that none of them can be regarded as demonstratively proven. In the doxographies of the earlier philosophers, however, the question is seldom touched upon in a cosmological context.

(2) **Sources.** The subject of the void was raised in two different contexts, as appears in A's two chapters devoted to it. In ch. 1.18 entitled *Περὶ κενοῦ* the discussion focuses on the void as a feature of physical reality. The source for this approach is Aristotle's analysis in *Phys.* 4.6, where he gives a classic example of the use of the dialectical method. In this analysis, when discussing the views of Melissus and the Pythagoreans, he does briefly mention the cosmos, but the cosmological aspects of the question receive little emphasis. In the cosmological context of the *De caelo* it is only lightly touched on at 1.9 279a6–17. See the texts cited below in section E(b) General texts. The void is also prominent as one of the principles of the atomists, as amply indicated in ch. 1.7.13–16 as well as in ch. 1.8.

It would appear that the cosmological aspects of the theme came into greater prominence through the contribution of the Stoics, whose theory of the conflagration opposed both the views of Plato and Aristotle and the atomist tradition and incidentally raised interesting philosophical questions in relation to the existence of an extra-cosmic void, which in turn may have drawn renewed attention to earlier Pythagorean views. Numerous texts discuss the Stoic position. In addition our chapter records disagreement within the Stoic school, a common occurrence in Book 2; cf. chs. 2.5a, 2.14, 25, 27. We note, finally, that from the third century CE onwards the question is raised less often because of the growing dominance of the Platonic–Aristotelian world view. Proclus does not ask εἰ οὐδὲν ἐστὶν ἔξω, but rather πῶς οὐδὲν ἐστὶν ἔξω (text below section E(b)§4). Consistent with this development is the fact that the question occurs on a number of occasions in Philo of Alexandria writing at the beginning of our era, but is seldom alluded to by later Christian authors.

C Chapter Heading

The long double heading *Περὶ τοῦ ἐκτὸς τοῦ κόσμου, εἰ ἔστι κενόν*, combining an umbrella heading *Περὶ x* in the category of place with the question of existence already posed earlier in ch. 1, is found only in P^B and one of the main mss. of P^Q (K). P^{EG} have the shorter title *Περὶ τοῦ ἐκτὸς*, as do the other two main mss. of P^Q (P, Z) and also the index to Book 2. S does not use the chapter heading at *Ecl.* 1.18, where he cites material from this chapter. S^L has a longer version that combines the two parts of the title in P^B, *Εἰ ἔστι κενόν ἐκτὸς τοῦ κόσμου*, but this is contaminated from P^B; see text at Wachsmuth (1882) 32 and comments at *ibid.* 55; it is erroneously attributed to S by Diels *DG* 271. A somewhat similar variant is found in Ps *Εἰ ἔστι τι ἐκτὸς τοῦ οὐρανοῦ*, no doubt due to the Byzantine scholar's own intervention.

The long heading should be retained. Many of A's titles retain the formulation with εἰ, asking the question of existence which goes back to Aristotle's

formulation of the primary questions of science in *APo.* 2.1 and plays an important role in the *Placita*; cf. chs. 1.5, 2.3–4, 4.3 etc. and M–R 2.1.171. A himself uses the formulation with *ἐἰ* when giving the topic of this chapter as an example of a physical *quaestio* in Book 1.proœm. For examples of double headings combining *περί* and *ἐἰ* see 4.23, 5.29 (but in these headings there are two subjects linked with *καί*). The shorter heading also obscures the important link to ch. 1.18 *Περὶ κενοῦ*.

D *Analysis*

a Context

Assuming a single cosmos as in the previous chapters 2.6–8, A now asks whether or not it is surrounded by empty space. The subject has already been touched on in chs. 1.5 and 2.1, but most significantly in ch. 1.18 *Περὶ κενοῦ*, which reveals a substantial overlap with the present chapter.

b Number–Order of Lemmata

The witnesses point to four doxai and there is no evidence to suggest that A's chapter contained more. Since the tradition of P preserves all four, the order is also not in doubt.

c Rationale–Structure of Chapter

Just as was the case in ch. 1.18, the chapter is organized along systematic lines. There is a main diaphonia between two opposed positions, (a) that there is an extra-cosmic void and (b) that there is not. The former view is represented by three successive doxai: (i) there is a void sufficient for cosmic-inbreathing attributed to the Pythagoreans (= P1–S1); (ii) there is a void which is infinite, allowing the cosmos to be dissolved in the conflagration, attributed to the Stoic school (= P2–S2); (iii) there is a void so that the cosmos can perish, but it is finite, attributed to the Stoic philosopher Posidonius (= P3–S3). The last two of these doxai also very clearly form an antithetical pair. The second position, that there is no extra-cosmic view, is represented by the philosophers Plato and Aristotle (= P4–S4).

As already noted above, there is considerable overlap with the structure and contents of ch. 1.18. In that chapter the first group of three lemmata deals with the existence of the void in general. The second group of three then discusses the question of the void in relation to the cosmos. The two chapters can thus be compared as follows:

A 1.18	A 2.9
§§1–2 existence of void denied	§1 external void for respiration (~ 1.18.6)
	§2 unlimited external void for conflagration (~ 1.18.4)
§3 unlimited void	§3 limited external void for conflagration
§4 internal but no external void	§4 no internal or external void (~ 1.18.1–2)
§5 no internal but unlimited external void	
§6 limited external void for respiration	

It can be seen that the two chapters complement each other, with neither possessing all the elements for a complete treatment of their subjects. We note the following. (1) Ch. 1.18 starts with the issue of the void’s existence, which is denied (same procedure in chs. 1.7 (gods), 1.23 (generation/destruction), 1.30 (nature)). Ch. 2.9 raises the question of existence in its chapter heading, but starts with a positive answer and ends with denial of its existence. (2) Ch. 1.18 includes the atomist position, which was a standard component of the doxography, but does not relate it to the cosmological position of multiple kosmoi separated by the (external) void. Ch. 2.9 omits this view entirely, even though it is very relevant to its topic. This view is more clearly articulated in Ach. (3) The mention of a void internal to the cosmos in the last doxa of ch. 2.9 does not cohere with its title. Moreover the view of Strato that there is internal but no external void (i.e. 1.18.4) is not included.

d

Further Comments

Individual Points

§1 This doxa is clearly the same as the one attributed to Aristotle at A 1.18.6. See our comments there (Commentary D(d)§6), where we argue that the doxographer has presented the Stagirite as a kind of Pythagorean.

§2 The reading of P^E and S, ἄπειρον, is clearly to be preferred to that of P^B, τὸ ἄπειρον, both because of the contrast with the next lemma, and because the Anaximandrian concept of the infinite (A 1.3.2) is not relevant here (in A it is found elsewhere only at 1.3.9, Epicurus). See also Algra (1993) 481–482, who suggests the article was inserted when ἄπειρον was wrongly taken to be the subject of the sentence. We note also Ach §8.2 18.1 οὐ μὴν ἄπειρόν φασι and *Commentaria in Aratum*, Anon. I, p. 93.1 Maass ἀλλ’ οὐκ ἄπειρον, both in Stoic doxai.

§3 This lemma has given rise to much discussion. All our sources with one exception state that the orthodox Stoic view was that the extra-cosmic void was infinite in extent (see texts below section E(a)§2). The one exception is Ach, but he appears to have mistakenly taken the exceptional view as the orthodox one. The doxa attributed to Posidonius thus records a deviation from orthodoxy. Many scholars, including Kidd (1988) 393, consider this position unlikely. In a full discussion, however, Algra argues that Posidonius may well have been dissatisfied with the Chrysippean argument for the existence of an infinite void, postulating (perhaps) that, just as place (τόπος) obtains its limit from the occupying body, so the void is limited by the maximum extent of its one-time occupant, i.e. the cosmos at the time of its conflagration. See Algra (1993) 495–504 and for a different view Primavesi (2018) 116.

§4 We have opted for the retention of the double name-label Plato–Aristotle as found in P^{EQ}. It should be noted, however, that it is not supported by S who only ascribes the doxa to Plato in a coalesced cluster, but also not by G, who in his final doxa also has only the name-label Plato. Jas in an unpublished review of Bottler (2014) suggests that S and G may independently have the original reading, and that a gloss may have entered the tradition in two stages, first as the name-label in E and Q, and then later the longer description with the false reference in P^B. In our view this hypothesis is not compelling. It is simpler to assume that S considered that the Aristotelian viewpoint was sufficiently covered at 1.18.1c (from 1.18.5 and AD). As for G, he could have easily dropped the name-label in his epitomising.

There are no other examples of this particular double name-label in P, but for the triple name-label Pythagoras–Plato–Aristotle see A 2.10.1, 4.29.1, 5.4.2. A generally connects two name-labels with καί, so we might perhaps conjecture Πλάτων <καί> Ἀριστοτέλης here. But there are exceptions, e.g. at A 1.11.3, 1.23.1, 2.8.1 etc., so it is not justified to alter the text.

e Other Evidence

The text in the recently discovered fragment of a Commentary on the *Categories* of Aristotle (perhaps to be attributed to Porphyry) is of great interest. As noted above in ch. 1.18 Commentary B(1), the text appears in a logical context and thus speaks of προτάσεις rather than δόξαι. But the method of division that it uses and the coupling of name-labels with philosophical positions is exactly the method so often used in the *Placita*. It would not surprise if the contents are traditional and that Porphyry (if indeed he is the author) took them over from an earlier commentary which had in turn made use of the doxographical tradition. The name-labels are exactly those of the tradition in which A stands, as the combined evidence of chs. 1.18 and 2.9 clearly shows.

The texts in Ach and Aratea I also stand in this tradition and verbally are even closer to A. It is to be noted how the text in Ach refers to ‘unlimited kosmoi’ and the text in the Aratea to the distinction between ‘the whole’ and ‘the universe’. Both of these themes occur in ch. 2.1. There is in fact a strong degree of interconnection between all the chapters in chs. 2.1–10, both in A and in closely related sources. As noted above in section D(c), the presence of the atomist doxa in Ach is a strong indication that it was also originally present in earlier versions of this chapter in the anterior doxographical tradition.

A 5.7.4–5 (de partu sexus virilis et muliebris) Ἀναξαγόρας Παρμενίδης τὰ μὲν ἐκ τῶν δεξιῶν καταβάλλεσθαι εἰς τὰ δεξιὰ μέρη τῆς μήτρας, τὰ δ' ἐκ τῶν ἀριστερῶν εἰς τὰ ἀριστερά· εἰ δ' ἐναλλαγείη τὰ τῆς καταβολῆς, γίνεσθαι θήλεα. Λεωφάνης, οὗ μέμνηται Ἀριστοτέλης, τὰ μὲν ἐκ τοῦ δεξιοῦ διδύμου τὰ δ' ἐκ τοῦ ἀριστεροῦ. A 5.11.2 (de similitudine ad patrem aut matrem) Παρμενίδης, ὅταν μὲν ἀπὸ τοῦ δεξιοῦ μέρους τῆς μήτρας ὁ γόνος ἀποκριθῇ, τοῖς πατράσιν· ὅταν δ' ἀπὸ τοῦ ἀριστεροῦ, ταῖς μητράσιν.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

(1) In the P tradition, as for chs. 2.6–9, the chapter is represented by the four main witnesses. There is very little variation between them. All have just the two doxai (P₁, P₂). G, clearly striving for variation, replaces τὰ ἀνατολικά μέρη with τὰ ἐφῶα and τὰ δυτικά with τὰ ἐσπέρια. The evidence of Nicolaus' translation shows that the chapter heading in his Greek text referred to both the right and the left, but without mentioning the cosmos. In the Byzantine mss. it is the other way around, with mention of the cosmos but not the left parts. Jas rightly restores the longer title, though without a second τίνα. As at A 2.8. it is a surprise to see that Psellus retains the title, though not the contents.

(2) Both P's lemmata can be located in S's chapter 15 Περὶ σχημάτων. He sees a link between the chapter's subject and the mainstream view that the cosmos is spherical. The second Empedoclean doxa is written out first in a cluster of

three, in which it occurs last (= S1). It is immediately followed by the other doxa attributed to Pythagoras–Plato–Aristotle (= S2). This lemma is much longer than the corresponding one in P (P1).

(3) Predictably there is no trace of this chapter in T.

(4) Two texts in the later chapters of Ach's compendium briefly touch on the left and right sides of the cosmos, both with reference to the Pythagoreans (one anonymously) and the poet Homer. We discuss these texts in the following section.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Like ch. 2.8 this chapter asks a quite specific question about the cosmos. The texts in Philo and Ach with the tell-tale Homeric quotation lead to the surmisal that this question was present in the proximate tradition. The specific question, however, appears nowhere in writings belonging to this tradition.

(2) *Sources.* The original source of the question posed in this chapter may well have been a discussion in Aristotle's *De caelo* 2.2, where at the beginning of the chapter he notes that some people ask whether there is a left and a right (τι δέξιον καὶ ἀρίστερον) part of the heaven (note how a clear echo of Aristotle's formulation survives in the heading of A's chapter). He then mentions the Pythagoreans and criticizes them for only speaking of left and right, and not of above and below and back and front. He then gives his own view in which surprisingly the southern hemisphere is the upper part. Aristotle is also recorded as having discussed these matters in a separate treatise on the Pythagoreans (fr. 205 Rose, fr. 15 Ross).

There are three further entwined traditions that have to be taken into account. (1) In his description of the World Soul at *Tim.* 36c Plato says that the movement of the Same revolves to the right by way of the side, that of the Different to the left by way of the diagonal. Various commentators (Calcidius, Proclus, Philoponus) claim that this is consistent either with Aristotle or Homer or both (see texts below section E). (2) In addition, Philo, Calcidius, Philoponus and Simplicius all join Ach in citing the Homeric verses at *Il.* 12.239–240 and deducing from them that for Homer, as for Plato and Aristotle, the eastern regions are on the right and the western regions on the left. (3) At the same time Ach records the view, which he attributes to the Pythagoreans, that the north is on the right and the south on the left. This is similar to the view of the Stoics in Cleomedes, which is based on the cosmos moving forward from east to west, and of course differs from the view attributed to Pythagoras in A.

C Chapter Heading

The title is preserved only in the tradition of P. It is not referred to by S in his heading for *Ecl.* 1.15, which includes material from this chapter. It is found in the index in S^L, but this is contaminated from P^B; see above ch. 2.5 Commentary C.

The chapter heading asks questions in the category of relative position (χεῖ-σθαί, cf. ch. 2.7). There is agreement on the heading in P^{BEQPsSy}. As we have seen, G has abridged it only very slightly. The same title is found in S^L, where it has been introduced from P. The only other chapter heading in Book 2 starting with the interrogative τίς is 2.13, but there are a number of examples elsewhere (χεῖσθαί e.g. chs. 1.1–2, 1.7, 2.13, 4.3, 4.5, 5.3, 5.17), mostly seeking to answer the quaestio of existence or essence, which is not the case here. As noted above, the formulation of the chapter heading goes back to Aristotle's *Cael.* 2.2 284b6–7.

D Analysis

a Context

This chapter is the final one asking questions of the cosmos as a whole. It follows on quite naturally from chapters on the cosmos' motion, order and location, but is nevertheless somewhat of an oddity. There is an implicit analogy with a living being (one of the options laid out in ch. 2.3) such as a human being. See chs. 5.7 and 5.11 where aspects of human life are related to the right and left parts of the womb.

b Number–Order of Lemmata

There is no evidence that there are more than the two lemmata found in P and S. Since the epitomator P preserves the order of doxai much more faithfully than the anthologist S and S's procedure can easily be reconstructed, P's order should be retained.

c Rationale–Structure of Chapter

In both Aristotelian (cf. *Cael.* 2.2) and Stoic (cf. Cleom. *Cael.* 1.1.150–157) cosmology it is assumed, since the cosmos is a living body with its own motion, that it is legitimate to ascribe directions to it. The first doxa is given the authoritative name-labels of Pythagoras, Plato and Aristotle, and represents the majority view of the standard cosmological model. It assumes that the cosmos makes a daily rotation around a fixed north-south axis and takes the perspective of an observer in the northern hemisphere facing north. The second doxa is an earlier Presocratic view that, given the lack of explanation, is not easy to understand. It may presume a vortex model of the cosmos, but could also be based on the movement of the sun from north to south along the ecliptic in the northern

hemisphere (as suggested by Bollack 1965–1977, 3.277). In this case it would be closer to the Stoic view put forward in Cleomedes, in which the observer faces west.

The two doxai naturally form a diaeresis, but what is the opposition between them? Perhaps it might be between east and west on the one hand and north and south on the other. It could also be between the standard orthodox view and a more exotic view belonging to the earlier history of cosmology. This would continue the opposition prominent in ch. 2.7.

The multiple name-label of Pythagoras, Plato and Aristotle occurs elsewhere only on three occasions in the *Placita*: 2.23.8 (on the solar solstices, with Plato preceding Pythagoras), 4.20.1 (on whether the voice is incorporeal), and 5.4.2 (on whether semen is a body). The reason for Pythagoras' presence can only be guessed at. It is possible that it happened because his followers are mentioned in the discussion in Aristotle, or he may stand for the Pythagorean tradition embodied in the *Timaeus*. At any rate, it would appear that an opportunity has been missed to contrast the mainstream view with the differing view of the Stoics. As for the chapter's second doxa attributed to Empedocles, there are no parallels for it in the remains of his poems or the reports based upon them.

d Further Comments

Individual Points

§1 The text of the first doxa as found in S has three additions when compared with the P tradition. (1) The words διὰ τὰς ἀνατολάς are quite superfluous and should be regarded as a gloss, as seen by Heeren and followed by all subsequent editors. (2) A lemma with a doxa attributed to Zeno is repeated from S 1.14.6a and has no place here. It most likely derives from AD; see further on ch. 1.14 Commentary A.2(d). (3) The remaining part of the doxa not found in P is much more problematic. It is argued that there is no height or depth in the cosmos because it is uniformly centred on itself, the view expressed by Plato in *Tim.* 62c–d, but later rejected by Aristotle and the Stoa. Diels and Wachsmuth retain the passage, but the way it is connected to the remainder of the doxa with the vague verb φασί is unusual and suspicious. Stylistically the passage could derive from AD, but would then have to come from his treatment of Plato, almost none of which survives; cf. M–R 1.256, 3.322, 331. The topic is only marginally related to that of the rest of the chapter. We place the text in braces to indicate that its place in A must be considered uncertain (as we now think, *pace* M–R 2.2.432). Bottler (2014) 348 suggests it may be assigned to another chapter and that 1.12 Περί σωμάτων might be suitable. The application to the cosmos, however, speaks against this possibility.

E Further Related Texts

a Proximate Tradition

General texts: Philo of Alexandria *QG* 1.7 tr. Marcus (exegesis of Gen 2:8) 'Why is He said to have planted Paradise in Eden towards the East? In the first place, because the movement of the world is from East to West; and that from which movement starts is first. Second, that which is in the region of the East is said to be the right side of the world, while that in the region of the West is the left. And so the poet (sc. Homer) testifies (*Il.* 12.239–240), calling the birds in the region of the East 'right', and those which are in the region of the West 'on the left side'.'

b Sources and Other Parallel Texts

- §5 A 1.3.21 Ἀριστοτέλης δὲ Νικομάχου Σταγειρίτης ἀρχὰς μὲν ἐντελέχειαν ἦτοι εἶδος ὕλην στέρην· στοιχεῖα δὲ τέσσαρα, πέμπτον δὲ τι σῶμα αἰθέριον ἀμετάβλητον. A 1.7.23 Ἀριστοτέλης τὸν μὲν ἀνωτάτω θεὸν εἶδος χωριστόν, ἐπιβεβηκότα τῇ σφαίρᾳ τοῦ παντός, ἣτις ἐστὶν αἰθέριον σῶμα, τὸ πέμπτον ὑπ' αὐτοῦ καλούμενον. A 1.12.3 Ἀριστοτέλης μηδὲν δὲ πῦρ κυκλοτερώς φύσει κινεῖσθαι, μόνον δὲ τὸ πέμπτον σῶμα. A 2.7.5 Ἀριστοτέλης πρῶτον μὲν αἰθέρα ἀπαθῆ, πέμπτον δὲ τι σῶμα. A 2.13.12 Ἀριστοτέλης ἐκ τοῦ πέμπτου σώματος. A 2.20.11 Ἀριστοτέλης σφαῖραν ἐκ τοῦ πέμπτου σώματος. A 2.25.8 Ἀριστοτέλης (ἐκ τοῦ πέμπτου σώματος). A 2.30.7 Ἀριστοτέλης μὴ εἶναι αὐτῆς ἀκήρατον τὸ σύγκριμα διὰ τὰ πρόσγεια ἀερώματα τοῦ αἰθέρος, ὃν προσαγορεύει σῶμα πέμπτον.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

The chapter is found in a direct transmission only in the family of P and in S. The former has three lemmata, representing the views of Anaximenes–Parmenides (P₁), Empedocles (P₂) and Aristotle (P₃). In the Byzantine mss. this final lemma is garbled. It is slightly better preserved in G and Q, but still makes very little sense. The absence of the lemma in E is perhaps an indication that the end of the chapter was corrupted early. Most of the chapter as found in P is utilised by

a Byzantine school teacher in a document edited by Rose (1875). Unfortunately he only published excerpts and he erred when he surmised that the source was S.

The situation in P is immediately clarified when S is adduced. He preserves a block of five lemmata, the first two of which correspond to the doxai in P (S₁, S₂; on the double name-label in S₁ see D(d) below). The remaining three correspond to the defective version in P^{BG} as follows:

P ₃ Ἀριστοτέλης ἐκ πέμπτου σώματος	= S ₅ (Aristotle)
† πυρὸς ἢ † (G πύρινον εἶναι τὸν οὐρανόν, Q <i>feurigen</i>)	cf. S ₄ πύρινον (Parmenides etc.)
ἐκ θερμοῦ καὶ ψυχροῦ μίγματος.	= S ₃ ἐκ θερμοῦ καὶ ψυχροῦ μίγματος, but with the name-label of Anaximander

We note the order of the three doxai in P is the reverse of what we find in S. How this might have occurred is discussed below in section D(c). For the further evidence in Ach and the Scholion on Basil see below section D(e). On a possible fleeting reference to P's text of this chapter in Julian the Arian see ch. 2.12 Commentary A.

The Aristotelian doxa in S is followed by another seven lines of text that are very unlikely to be derived from A. He first writes λέγει γοῦν ἐν τοῖς Περὶ τῆς φυσικῆς ἀκροάσεως καὶ οὐρανοῦ (mss. αὐτοῦ, emend. Spengel) λόγοις οὕτως and then follows these words with a quote from AD (fr. 9 Diels) which speaks of both the stars and the heaven and had already been quoted earlier at 1.21.1c. The word οὕτως can look both forwards and backwards, but the former is much more likely than the latter, especially when a quote or excerpt follows: cf. 1.8.45, 1.18.4c, 1.20.6, 1.22.1f etc. Diels *DG* 216 persuasively argued that the words had been added by S and that he had amplified the Aëtian doxa 'ex scholastica memoria'. As Mansfeld (2016a) 301 observes, 'the formula γοῦν + title is regularly used to introduce S's verbatim quotations from a Platonic dialogue', though here he refers to a summary by AD of his doctrines in *Phys.* and *Cael.*

B Proximate Tradition and Sources

(1) *Proximate tradition.* For this chapter and a number of others in the remainder of the book a text at Philo *Somn.* 1.21, overlooked by Diels, is of great interest. It was discovered by Wendland, who concluded that it (and the longer section 21–32 which it commences) was dependent on Diels' postulated *Vetusta placita*; see Wendland (1897) 1075. In illustrating the unknowability of both the heavens and the soul, Philo clearly draws on a doxographical compendium similar to that of A but anterior to him. On this and related texts in

Philo's Allegorical Commentary see Runia (2008b) 24–29. On the doxai relating to the soul see further Mansfeld (1990a) 3117–3122 and below on ch. 4.2–7. Philo does not use any name-labels at all in his excerpts but doxai can easily be recognised. In the case of this chapter three of A's doxai appear (Empedocles, Parmenides etc., Aristotle) in an order which agrees with S against P (the phrase μηδενός τῶν τεττάρων στοιχείων μετέχον may conceal a reference to the Platonic view utilised for the stars at 2.13.11). Further texts in Lactantius and Arnobius may also have distant links with the *Placita* tradition. The former preserves a reference to Empedocles' 'congealed air'. Texts in Basil and Gregory of Nyssa link the doxography to biblical material, with the same pronounced sceptical emphasis already present in Philo. Similarly Isidore of Pelusium raises the question of whether the heaven is a sphere or a hemi-sphere, perhaps a distant reflection of §2. All these parallels show that on this subject A stands in a broader doxographical tradition. In later philosophical texts (Alexander, Philoponus, Simplicius) the focus narrows to the difference between Platonic and Aristotelian views (we note that Philoponus uses the topic to illustrate a question of essence or substance, τό τί ἐστίν).

In general, it must be noted that the *quaestio* of the heaven's οὐσία is not often posed, as distinct from that of the heavenly bodies within it. An exception is Seneca who explicitly mentions the topic as part of the investigation of the *caelestia* and illustrates it with the interesting diaeresis between a solid and a tenuous substance (he favours the latter view as the polemic in *Nat.* 7.13–14 against a certain Artemidorus of Parium shows). This diaeresis is also found in an earlier text in Epicurus. Texts cited below in section E(a,b). As we shall see below, it is implicit in the structure of A's chapter.

(2) *Sources.* The material on this question as treated by Presocratic authors will have been derived from original works and later summaries (probably in the Peripatos). As the lack of parallels shows, none of this evidence appears to have been preserved outside the *Placita* tradition. For later authors (Plato, Aristotle, Stoics) there was sufficient material that could be adapted, but A refers only to Aristotle's famed quintessence. One might have expected a Platonic view, but in the *Timaeus* Plato speaks only of the substance of the heavenly bodies in general (cf. ch. 2.13). An extrapolation could of course have been made, as occurs in the Scholion on Basil, on which see further below Commentary D(e).

The only authors of which a work with the title Περὶ οὐρανοῦ has been recorded are Aristotle (extant) and his followers Theophrastus and Strato (for references see section E(a) Chapter heading). In Aristotle, as cogently argued by Johnson (2019), the term οὐρανός refers to the whole of physical reality, i.e. the universe, rather than to the heavens as part thereof; see further ch. 2.1 Commentary C.

C Chapter Heading

The witnesses reveal a wide variety of headings for the chapter. They can be summarised as follows:

short: *Περὶ οὐρανοῦ*—E and G

longer: *Περὶ τῆς (τοῦ) οὐρανοῦ οὐσίας*—Q, Ps and S

elaborate: *Περὶ οὐρανοῦ, τίς ἢ τούτου οὐσία*—P^B, cf. Ach and Sy

The short version simply gives a general umbrella heading of the *Περὶ x* type, comparable to the heading of ch. 2.1 *Περὶ κόσμου*. The longer one includes the specification that the chapter treats the category of substance, and this is emphasised even more in the elaborate version that actually poses the question of the substance. It is impossible to determine with certainty which heading originally stood in A. The oldest witness E has the short version, supported by G (they also contain a similar short title for the chapters on the sun, A 2.20, and the moon, A 2.25). A similar divergence between short titles without the term *οὐσία* and longer titles with the term is found in the case of other chapters which discuss the substance of various physical entities:

2.13 on the heavenly bodies: no short titles (but cf. Ach §10)

2.20 on the sun: short title EGP^B (ms. Marc. 521), longer title P^B (other mss.) QS

2.25 on the moon: short title EG, longer title P^BQS

3.9 on the earth: short title EGQ, longer title P^BS (but without *οὐσία*)

4.2–3 on the soul: 4.2 has shorter title, 4.3 longer title with *οὐσία* (on corporeal soul)

5.3 on semen: no short titles, longer title P^BGQ

The conclusion to be drawn from this astounding variety is that the tradition of chapter headings was fluid and that ‘the length and precise wording of the chapter headings were not a matter of rigorous discipline, but rather of convenience’ (M–R 2.197). It seems to us very likely that the original heading contained a reference to the subject of *οὐσία*, but whether we opt for the longer or the elaborate title is quite arbitrary. We have decided on the elaborate title, which has a fine early parallel in Ach. But certainty cannot be attained.

D Analysis

a Context

Having completed his chapters on the cosmos as a whole (chs. 2.1–10) A now turns to its most eminent part, the heaven. The *οὐρανός* has already been extens-

ively mentioned in chs. 2.5–7 (and also in 1.4 and 1.6), but now it is the main subject. This chapter is the first of five devoted to the οὐσία of parts of the cosmos (cf. chs. 2.13, 2.20, 2.25, 3.9). In the case of the heaven only two chapters discuss its features, many fewer than in the case of the other phenomena (stars 7, sun 5, moon 7, earth 7).

b Number–Order of Lemmata

There is no evidence to suggest that the chapter had more than the five lemmata preserved in S, all of which are also—even if sometimes imperfectly—witnessed by P. As already noted, however, the order of the final three lemmata is problematic. Normally P is a more reliable guide to lemmatic order than S. In addition, S has a reason for placing the Aristotelian doxa last, because he wishes to add a quote from AD (on which see further D(d) below). But we also need to take the overall structure of the chapter into account before making a decision.

c Rationale–Structure of Chapter

The term οὐρανός can have various meanings in early Greek thought. As Aristotle sets out very clearly in *Cael.* 1.9 278b9–21, it has at least three: (1) the outer periphery of the world; (2) the region which contains the planets; and (3) the world as a whole (cf. Plato's usage at *Tim.* 28b2; see further on κόσμος and οὐρανός the note at ch. 1.6 Commentary D(d) on §1[7–25] and §1[14–16]). The first lemma clearly indicates that the first meaning is meant, and the second follows on well from it. These two doxai regard the heaven's nature as solid, whether of earth or congealed air. For the remaining three the meaning is less clear. Both the first and second meaning would appear to be relevant. Those views attributed to Parmenides etc. and to Aristotle also form a plausible pair. The doxa that the heaven is fiery is the most common, as is perhaps indicated by the multiple name-labels. Aristotle's view is in contrast because his special element, though also called αἰθήρ, is not fiery. In chs. 2.13 and 2.25 (but not in 2.20) this view is contrasted with that of Plato, but as already noted no mention is made of the Platonic view, unlike in all the other chapters on the οὐσία of the cosmos' parts.

This leaves us with the remaining doxa of Anaximander. It would seem to be a *Fremdkörper* in the chapter. What does it mean that the heaven is 'from the hot and cold mixture'? Does this mean that it *consists* of a mixture with these two qualities? This is not so easy to place, although it is possible that A saw a link with Empedocles' view of air (cold) being congealed by fire (hot). However, a text in ps.Plutarch *Stromateis* may give us a clue (text cited below in section E(a)§2). It speaks of a 'part of the everlasting (i.e. the ἀπειρον) that was generative of hot and cold separated off at the genesis of this cosmos', i.e.

the hot and cold mixture was the source of the heaven, not what it consisted of (an earlier text in Aristotle speaks allusively of the same mixture; text *ibid.*). This is likely to have been the origin of A's doxa, but that does not mean that he intends it to be understood in the same way.

It was noted above (Commentary B) that two of the infrequent doxographical parallels cast the question of the heaven's nature in terms of a diaeresis between a solid and a tenuous composition. It is possible to interpret the structure of A's chapter in these terms. The first two doxai present the heaven as consisting of a dense compacted substance (i.e. earth or crystalline), the final two (in S) as of a light substance (i.e. fire or the quintessence). The remaining doxa of Anaximander remains difficult from the Aëtian perspective, but might be taken as a compromise view, if a similar text at A 2.20.15 is adduced. This doxa, attributed to Empedocles, states that 'the sun and the moon have been separated off from the Milky circle, the former from the more rarefied mixture which is hot, the latter from the denser (mixture) which is cold,' i.e. the hot is explicitly identified with the rare, the cold with the dense. In terms of Anaximander's cosmology one might see a connection with the revolving circles of fire and mist.

The structure of the chapter can thus be interpreted in terms of a main diaeresis between two positions, each with two doxai, and a compromise view in between. A's love of symmetrical structures has been amply demonstrated: see the remarks at M–R 2.657. Another possibility might be to see the chapter as moving through the various elements—earth, crystallized air, mixture of hot and cold, fire, quintessence. But this must be considered less likely, especially in light of the doxographical parallels. In whichever way it is interpreted, it is plain that the order in S makes more sense than that in P. The Aristotelian doxa can be read as trailing the others because it an exceptional view (as in chs. 2.13 and 2.25). If this is right, it remains difficult to see how the reversal of the order occurred in the tradition of P, except through the fact that the text became defective. Further evidence is found in both Ach and the scholion to Basil, both of which corroborate the order in S rather than that in A. They both end with a reference to Aristotle, the former using the name-label (but with an erroneous doctrine), the latter with the reference to the fifth element (but anonymously).

d Further Comments *Individual Points*

§1 This brief doxa gives rise to numerous textual and interpretative issues.

(1) The double name-label Anaximenes and Parmenides in S is dubious, since Parmenides recurs as the first name in §4. Although it often occurs in A that a name-label is repeated within a chapter (already pointed out in Runia

1992, 133, see also M–R 2.461, 523), this would be a particularly bold case. However, it is much easier for P to drop the name-label than for S to add it. At M–R 2.436 we suggested that the wrong name was written out or that the doxa was inspired by the description of the cosmos at A 2.7.1, and we deleted it from our reconstructed text. It is safest, we think now, to retain it.

(2) The text is difficult, with each of the five witnesses offering a different version for its final words. The main question is whether the sentence states the nature of the periphery of the cosmos (with γῆς as a genitive of quality), as we have translated it above, or whether it merely offers a description of what the heaven is (somewhat like the nominal definitions in Book 1 and the opening definition on the cosmos in A 2.1.1). It has been understood in the latter sense by Wöhrle (2012) 267, who translates (accepting Diels' emendation) 'Anaximenes [sagt, dass der Himmel] der äußerste Umkreis der Erde sei.' This is doubtless the way that S and E (but with a corrupt text) understood the doxa. P^B, however, probably understood it as in our translation, altering the genitive to the adjective γῆινον (*pace* Jas, who thinks it is a corruption of γῆς εἶναι). The same is probably the case for G. The fact that §2 repeats the heaven as subject is an argument for it not being understood in §1. As noted in the textual apparatus, the variant translation in Q is best explained through dittography. The doxa that the outer edge of the cosmos is earthy is of course quite odd, but it seems the doxographer envisages a solid edge (but not crystalline, which is not earthy, cf. §2 and the scholion no. 22 in Pasquali's collection).

§4 It might be thought that the words εἶναι τὸν οὐρανόν were added by S, since they are otiose in relation to the chapter's title. But their inclusion by G militates against this view.

§5 A uses the term πέμπτον σῶμα for the Aristotelian quintessence six times (seven if the conjecture at 2.25.8 is accepted), beginning at 1.3.21; see the *loci Aëtiani* above. As noted by Moraux (1963) 1226 in his magisterial article on the *quinta essentia*, although Aristotle himself calls the element the πρῶτον σῶμα, in the doxographical tradition there is a strong preference for terms involving the term 'fifth', which never occur in the corpus of Aristotle's writings. The earliest use of the term used here appears to be at Philo *Somn.* 1.21, cited below in section E(a) General texts as evidence of the *Placita* tradition prior to A. Thereafter it is found in Taurus, Sextus Empiricus, ps. Justin etc. Plutarch speaks of a πέμπτη οὐσία at *De E* 390A (also at Philo *QG* 4.8 Petit). The validity of Aristotle's doctrine was a hot topic in the first century BCE and CE. The last philosopher to be mentioned in the *Placita*, the Peripatetic Xenarchus of Seleucia wrote a work Πρὸς τὴν πέμπτην οὐσίαν and argued against it; see Falcon (2011) 25–32. Psellus, who wrongly says that Aristotle names it a πέμπτον σῶμα, does not necessarily derive the term from P, for he uses it on a number of occasions elsewhere, e.g. in

his *Commentary on Aristotle's Physics* 4.7. On the doctrine in the doxographical tradition see further Moraux (1963) 1226–1228.

e Other Evidence

Some further evidence is supplied by Achilles and a scholion to Basil. The former text, with the related title *Τίς οὐσία οὐρανοῦ*, plainly stands in the same tradition as A, but its transmitted state is quite confused. Three of the name-labels coincide, but only one of the accompanying doxai (Empedocles). Yet here too there is a significant difference: heaven's solidity appears to be divided between the first anonymous doxa (it is—rather oddly—both fiery and στερεῖ-μνιος, the same term in A's Empedocles doxa) and the second doxa attributed to Empedocles (heaven is crystalline and compacted). If Maass' conjecture is accepted, then the doxa of Anaximander has an affinity with the one of Anaximenes in A, while the (obviously erroneous) final Aristotelian doxa is reminiscent of Anaximander in A. See further M–R 2.2.437. The doxography in the scholion to Basil is much clearer in the way it sets out four positions, three of which are parallel to what we find in A (but only one with a name-label, Empedocles again). Interestingly the scholion contains the (unattributed) Platonic view that heaven consists of a mixture of the four elements (actually the heavenly bodies) which is missing in A and Ach. As noted above, the order of the doxai supports the sequence in S over against that in P, with the Aristotelian view coming last in both texts.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

P and S have almost identical texts, consisting of two lemmata only. G includes both, but abridges and lightly paraphrases in his usual manner. The uncontroversial nature of the subject makes it of no interest to E. Remarkably a section from the first lemma is copied out by a certain Julian in a Commentary on the Old Testament book of Job. The first part is reproduced in a paraphrase, the second is cited in a *verbatim* quote. The author has been identified as a follower of Arius writing most likely in the fourth century (CPG 2075). The references to Books 2 and 3 were identified by the editor Hagedorn (1973); see further General Introduction, section 4.2.5. There may be fleeting references to P at p. 274.6 (κρυσταλλοειδῆ, cf. A 2.11.2) and p. 274.12 (κωνοειδῆ, cf. A 2.2.2).

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The first mention of the question regarding heavenly zones in a doxographical source is found in the Stoic doxography in Diogenes Laertius (text below section E(a) General texts). The main interest from a doxographical viewpoint appears to have been the identity of the person who first

discovered (or postulated) the heavenly circles and in particular the tilting of the zodiac, with various contenders being put forward for the two roles (see texts below section E(a) General texts). This interest is reflected in our chapter. In general such identifications seem to have begun early (see the citation of Theophrastus at D.L. 8.48 = fr. 227E FHS&G discussed above on ch. 2.1 Commentary D(d)§1)). We note too that the subject is exploited by the arithmo-logical tradition in relation to the number 5. On the discovery of the zones see A 3.14.1 and further Burkert (1972) 306.

(2) *Sources*. The division of the cosmos by means of five great circles corresponding to the five zones of the earth was an uncontroversial feature of the geocentric hypothesis. However, it is not described in any surviving author until the Hellenistic period (no mention in Aristotle and not even in the *De mundo*).

C Chapter Heading

The heading is of the common Περί x type, with the additional phrase containing the term πῶσος making it quite clear that its subject is posed in the category of quantity. P^B has the longer heading, which is paralleled (as we shall see) by the longer heading in ch. 3.14. The shorter heading is supported by the other witnesses G, Q and S (Ps and Sy are clearly dependent on P^B). Here too we opt for the longer title for the reasons set out in ch. 2.11 Commentary C. The heading with its reference to division and circles rather than zones, is not found outside A and his tradition.

D Analysis

a Context

After ch. 2.11 this is the only chapter specifically dedicated to the heaven before moving on to the heavenly bodies that populate it. There is a parallel chapter for the earth at 3.14 Περί διαιρέσεως γῆς καὶ πόσαι εἰσὶν αὐτῆς ζῶναι. In addition chs. 2.11 + 2.12 are closely parallel to chs. 3.9 (Περί γῆς καὶ τίς ἡ ταύτης οὐσία καὶ πόσαι) + 3.14 (with πόσαι in 3.9 also recalling 2.1).

b Number–Order of Lemmata

The number and order of the lemmata are not in doubt and there is no reason to suspect that lemmata have been lost.

c Rationale–Structure of Chapter

Most unusually, indeed uniquely in Book 2, this chapter does not record a plurality of doxai on the subject in question. The standard view on the heavenly zones is attributed to Thales, Pythagoras and their followers. Since the two are founders of the Ionian and Italian successions respectively, the name-labels

effectively cover the entire philosophical tradition. The second doxa is merely an additional comment on the discovery of the zodiac circle in the tradition of the πρώτος εὑρετής motif (on which see above ch. 1.3, Commentary D(d)§7[54–55]).

The formulation of the doctrine shows strong resemblances to brief reports elsewhere, both doxographical (see esp. the Stoic report in D.L. with its terms ἀρκτικὸν αἰεὶ φαινόμενον and ἀνταρκτικὸν ἀφανή) and arithmological (Plutarch, Anatolius).

d Further Comments

Individual Points

§1[6] There can be little doubt that λοξὸς ... ὑποβέβληται in P is the correct reading. S's combination of καλούμενος and ὑποκέκληται is unconvincing. Heeren's conjecture ὑπεκέκληται is brilliant (and may have been what S wrote), but does not weigh up against the combined weight of the P tradition.

For the final phrase of the lemma there is no difference in meaning between P's ἐπὶ τὸ ἀντίξουν and S's ἐπὶ τὸ ἀντικρύν. The preference should be given to the former as the *lectio difficilior*, his adjective being far rarer than S's adverb by a ratio of about 25 to 1.

§2 According to Theon of Smyrna (and also Diodorus Siculus, texts below section E(a) General texts), Eudemos in his account of Greek astronomy recounts that Oenopides was the discoverer of the obliquity of the zodiac. This directly contradicts the claim of plagiarism by A. Theon's statement goes back to an eminent source who is explicitly named, whereas A gives no authority for his claim. One must suspect that the tradition has been reworked in favour of a venerable school founder and is one more example of the tendency of the *Placita* to upgrade the role of Pythagoras (note also A 2.32.6, where the name-label Pythagoras follows that of Oenopides without further comment). See further the discussion at Abel (1974) 998, part of an exhaustive account of the ancient astronomical and geographical use of the concept 'zone'.

e Other Evidence

The Aratean tradition includes various texts (see above *Testes secundi*) on the circles of the heavens, but all of them are purely descriptive, without any reference to philosophers or scientists, i.e. parallel to what we find in handbooks such as Geminus and Cleomedes. See also ch. 3.14 Commentary D(e) on the parallel terrestrial zones.

Testes primi:

Theodoretus CAG 4.17–20

- 4.17.1 (~ §1) καὶ τοὺς ἀστέρας δὲ Θαλῆς μὲν γεώδεις καὶ ἐμπύρους ὠνόμασεν·
- 4.17.2 (~ §3) ὁ δὲ γε Ἀναξαγόρας ἐκ τῆς τοῦ παντός περιδινήσεως πέτρους εἶπεν ἀνασπασθῆναι, καὶ τούτους ἐκπυρωθέντας τε καὶ ἄνω παγέντας ἀστέρας ὀνομασθῆναι.
- 4.17.3 (~ §5) καὶ Δημόκριτος δὲ τοῦτον κρατύνει τὸν λόγον·
- 4.17.4 (~ §4) ὁ δὲ Διογένης κισσηροειδεῖς λέγει εἶναι τούτους, διαπνοάς τινας ἔχοντας·
- 4.17.5 (~ §7) ὁ δὲ Ἀναξίμανδρος ξυστήματα ἅττα τοῦ ἀέρος ἔφη, τροχοειδῶς πεπιλημένα, πυρὸς ἔμπλεα εἶναι, ἀπὸ τινων στομίων ἀφιέντα τὰς φλόγας.
- 4.18.1 (~ §10) Διογένης δὲ καὶ ἐμπίπτειν εἰς τὴν γῆν τινας τούτων ἔφησε καὶ σβεννυμένους ἐλέγχεσθαι, ὅτι λίθων ἔχουσι φύσιν, καὶ μάρτυρι χρῆται τῷ ἐν Αἰγὸς ποταμοῖς πυροειδῶς κατενεχθέντι ποτέ.
- 4.18.2 (~ §12) ὁ δὲ Πλάτων ὡς ἐπίπαν μὲν τούτους ἐκ τοῦ πυρὸς ξυνεστάναι, μετέχειν δὲ καὶ τῶν ἄλλων στοιχείων φησίν.
- 4.18.3 (~ §13) ὁ δὲ γε Ἀριστοτέλης τοῦ πέμπτου σώματος εἶρηκε ξυγγενεῖς.
- 4.19.1 (~ §14) Ξενοφάνης δὲ ἐκ νεφῶν μὲν λέγει πεπυρωμένων ξυνίστασθαι, σβεννυμένους δὲ μεθ' ἡμέραν νύκτωρ πάλιν ἀναζωπυρεῖσθαι, καθάπερ τοὺς ἄνθρακας.
- 4.20.1 (~ §15) Ἡρακλείδης δὲ καὶ ἄλλοι τῶν Πυθαγορείων τινὲς ἕκαστον τῶν ἀστέρων κόσμον ὑπάρχειν φασί, γῆν περιέχοντα καὶ ἀέρα.

Traditio ps.Plutarchi:

ps.Galenus HPh c. 56 (~ tit.) Τίς οὐσία τῶν πλανητῶν καὶ ἀπλανῶν (text Jas)

56.1 (~ P1) Θαλῆς ὑπολαμβάνει γεώδη μὲν εἶναι τὰ ἄστρα, ἔμπυρα δέ.

56.2 (~ P2) Ἐμπεδοκλῆς δὲ πύρινα μόνον.

56.3 (~ P3) Ἀναξαγόρας δὲ τὸν περικείμενον αἰθέρα ἀέρα πύρινον ᾤθη, τῇ δὲ εὐτονίᾳ τῆς παραλύσεως ἀναρπάσαντα πέτραι ἀπὸ τῆς γῆς καὶ καταφλέξαντα ταύτην ἡστερικέναι.

56.4 (~ P4) Διογένης δὲ κισσηροειδῇ τὰ ἄστρα λέγει καὶ διάπνοιαν αὐτὰ νοεῖται κόσμου.

56.5 (~ P6) Πλάτων δὲ ἐκ μὲν τοῦ πλείστου μέρους πυρίνους εἶναι τοὺς ἀστέρας ὑπολαμβάνει, μετέχοντας δὲ τῶν ἄλλων στοιχείων κόλλης τρόπον.

56.6 (~ P7) Ξενοφάνης δὲ ἐκ νεφῶν πεπυρωμένων συνεστάναι τοὺς ἀστέρας ἡγείται, σβεννυμένους δὲ καθ' ἑκάστην ἡμέραν ἡγείται ἀναζωπυρεῖσθαι νύκτωρ καθάπερ τοὺς ἄνθρακας. τὰς γὰρ ἀνατολάς καὶ δύσεις ἐξάψεις εἶναι καὶ σβέσεις.

56.7 (~ P8) Ἡρακλείδης δὲ καὶ οἱ Πυθαγόρειοι ἕκαστον τῶν ἀστέρων κόσμον εἶναι νομίζουσι γῆν περιέχοντα καὶ αἰθέρα ἐν τῷ ἀπείρῳ ἀέρι. ταῦτα δὲ τὰ δόγματα ἐν ἐνίοις Ὀρφικοῖς φέρεσθαι λέγουσι κοσμοποιοῦσι τῶν ἀστέρων ἕκαστον.

56.8 (~ P9) Ἐπίκουρος οὐδὲν ἀπογινώσκει τούτων ἐχόμενος τοῦ ἐνδεχομένου.

Psellus Omn.Doctr. c. 131 Τίς ἡ οὐσία τῶν ἀστέρων (~ tit.)

Symeon Seth CRN 3.39 Τίς ἡ τῶν ἀστέρων οὐσία (~ tit.)

Testes secundi:

Achilles Univ. c. 11, p. 19.22 Τίς οὐσία ἀστέρων (~ tit.)

pp. 19.23–20.10 Θαλῆς μὲν δὴ γῆνιν ἔμπυρον εἶπε τὴν τῶν ἀστέρων οὐσίαν (~ §1). Ἐμπεδοκλῆς δὲ πυρίνους αὐτοὺς εἶπεν. τινὲς δὲ γεώδεις εἶπεν αὐτοὺς ἐτόλμησαν (~ §2), ὧν ἐστὶ καὶ Ἀναξαγόρας· μετὰ γὰρ τὴν πρώτην φησὶ διάκρισιν τῶν στοιχείων τὸ πῦρ χωριζόμενον ἐπὶ τὴν ἰδίαν φύσιν ἀνασπάσαι καὶ διάπυρα ποιῆσαι καὶ τῆς γῆς μόριά τινα· ὅθεν καὶ τὸν ἥλιον ἔλεγεν εἶναι μύδρον (~ §3), ὡς ἐξῆς ἐροῦμεν. ἔνιοι δὲ κίσσηριν πλαγίαν οὖσαν ὑπὸ τῆς θερμότητος τοῦ αἰθέρος ἀναπτομένην ὑπὸ τῶν τρυμαλιῶν τοὺς ἀστέρας φαίνειν (~ §4). Πλάτων δὲ ἐκ τῶν τεσσάρων στοιχείων, πλείστου δὲ πυρός (~ §12). Ξενοφάνης δὲ λέγει τοὺς ἀστέρας ἐκ νεφῶν συνεστάναι ἐμπύρων καὶ σβέννυσθαι καὶ ἀνάπτεσθαι ὥσανεὶ ἄνθρακας, καί, ὅτε μὲν ἄπτονται, φαντασίαν ἡμᾶς ἔχειν ἀνατολῆς, ὅτε δὲ σβέννυνται, δύσεως (~ §14). οἱ Στωϊκοὶ δὲ ἐκ πυρός λέγουσιν αὐτοὺς, πυρός δὲ τοῦ θεοῦ καὶ αἰδίου καὶ οὐ παραπλησίον τῷ παρ' ἡμῖν· τοῦτο γὰρ φθαρτικὸν καὶ οὐ παμφαές (—).

Isidorus Pelusiota Ep. 1435.68–86 Énieux εἰ δὲ διὰ τὸ εἰρῆσθαι· τοῖς ἄστροις ἐνετειλάμην, ζῶα λογικὰ αὐτὰ καὶ αὐτεξούσια ὀριοῦνται τινες—οἷδα γὰρ τινας οὐ μόνον τῶν ζῶων τῆς πίστεως, ἀλλὰ καὶ τῶν πεπιστευκῶτων τοῦτο δογματίσαντας—περιττὴν καὶ ἀνωφελῆ τὴν ζήτησιν ταύτην εἶναι ἡγούμενος ..., οὐτ' ἐγκρίναιμι τοῦτο, οὐτ' ἀποψηφίσαιμι ... εἴτε οὖν λογικὰ ἐστὶ ζῶα, ὡς φασί τινες, εἴτε πύρινοι σφαῖραι, εἴτε δισκοειδῆ σώματα, ἐκ τοῦ αἰθερίου πυρός ἐξαφθέντα,

εἴτε σφαιροειδεῖς πυρὸς πιλήσεις, εἴτε μύδροι—τινὲς γὰρ τῶν φιλοσόφων τοῦτ' ἐδογματίσαν—εἴτε ὀχήματα δεκτικὰ τοῦ αὔλου καὶ ὑπερκοσμίου φωτός, οὐ σφῶδρα ἰσχυρισαίμην—οὐδὲν γὰρ τοῦτο πρὸς ἀρίστην πολιτείαν συντείνειν ἡγοῦμαι.

Commentary

A *Witnesses*

(1) This chapter, one of the longest in the *Placita*, is extremely well attested. In the case of P the four major witnesses testify to it and reveal nine doxai (G deletes only one, the second Empedoclean doxa).

(2) These nine are all found in S, who combines what corresponds to ch. 13–17 in P into a single chapter, using ch. 13 as his base (24.1), to which he appends as many doxai as he can, then adding doxai relating to ch. 15–17 (24.2–3), followed by a single doxa relating to ch. 19 (24.4) and finishing with some doxai from AD (24.5). For a detailed analysis of S's systematic procedure in this chapter see M–R 1.220–222. There are another five doxai not preserved in P, making a total of

14 doxai in S. On the possibility that S replaced a Stoic doxa with material from AD see below at section D(e).

(3) T has ten doxai, all of which can be found in S, but he divides up the single Diogenes doxa as found in P and S. It is important to note that three of these doxai are not in P, confirming that T used A independently from P; see Mansfeld (2018a) 182.

(4) In addition, six of the doxai are also found in Ach; see below section D(e). On the six doxai in a letter of Isidore of Pelusium see the following section (a)

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* An important witness to doxographical traditions on this subject prior to A is Philo, who continues his section on the obscure nature of the heavens at *Somn.* 1.22 (on which see on A 2.11 Commentary B) with a set of six doxai which form three contrasted pairs (see section E(a) General texts). Only the first pair are directly parallel to A's chapter and illustrate, as we shall see, the main diaeresis. But Philo places most emphasis on the implicit contrast between lifeless clumps (ὄγκοι, μύδροι) or beings with life (ἀρμονία). If they have life, then they will be ensouled (ἐμψυχοί) and move of their own volition. This may indicate an earlier doxographical tradition with a chapter on εἰ ἐμψυχα τὰ ἄστρα (parallel to ch. 2.3) which A did not utilize. Another brief reference to the subject of this chapter and following chapters is found at *Somn.* 1.53. For a further Philonic reference to the Anaxagorean doctrine see section D(e) below. A similar diaeresis is given by Seneca on the *natura* of the stars and planets. In addition a further text is found in the early fifth cent. CE Egyptian monk Isidore of Pelusium, a contemporary of S, T and Nem. This text has six doxai on the nature of the stars which perhaps stand closer to Philo than to A, but reflect the same doxographical tradition; see further M–R 1.311. A different approach is found in Hippolytus' summary of the doctrines of individual philosophers; doxai on the subject are located in the sections devoted to Anaximander, Anaximenes and Anaxagoras in the Ionian tradition; see section E(a) below. These certainly derive from the proximate doxographical tradition.

Standing much closer to A, however, is the chapter on the οὐσία of the heavenly bodies in Achilles. Indeed the correspondence to the doxai of this chapter in P is quite remarkable. See below section D(e) for a detailed analysis of this evidence.

(2) *Sources.* The subjects of this chapter and the three that follow it are very clearly marked out by Aristotle in his treatment of the heavenly bodies. He introduces it at the beginning of *Cael.* 2.7 and rounds off his discussion at the end of 2.12 (texts below at section E(b) General texts). The introductory passage includes three of the topics (that of order, cf. A 2.15, is missing), the

concluding passage refers to all four. In his recapitulation of his treatment of the subject of physics at the beginning of the *Meteorology* he mentions only the movement of the heavenly bodies (1.1 338a21, cited on ch. 2.16). Aristotle's treatment has very clearly determined the structure of the subsequent doxographical tradition. If, however, we turn to the specific subject of the substance of the heavenly bodies in general (as distinct from the planets and esp. the sun and the moon), we find that it is not extensively discussed. Aristotle himself, in *Cael.* 2.7, does not specifically engage with any of the philosophers mentioned in A, only arguing against the view that the heavenly bodies are fiery in very general terms (289a17).

The sources for the doxai in extant authors can be traced to a greater or lesser extent for Plato, Aristotle and Epicurus, but in each case the doxographical tradition has introduced interesting changes. See further discussion and texts below.

C Chapter Heading

The chapter asks a question in the category of substance. Differently from the parallel chs. 2.11, 2.20 and 2.25, however, the heading appears to be not of the umbrella Περὶ x type, but uses the interrogative pronoun τίς with the noun in the nominative, which occurs rather infrequently elsewhere (note esp. ch. 5.3, but also chs. 1.1, 1.7, 2.10, 4.5, 5.17; in 2.11 the two types are both used). But there is a great diversity of formulations, with each of the five major witnesses presenting a different version (excluding T, who generally yields little evidence for this aspect). See our earlier discussion at M–R 1.180–181 (to which can be added the evidence of Ps). Short titles referring only to the stars in general are found in S (using the Περὶ x formula as part of a combined heading covering all seven chapters on the heavenly bodies) and Ach, and also in two later representatives of P, Q and Ps. P^B has the fullest title. Not only it is specified that by the term ἄστρα both the fixed stars and the planetary bodies are meant (though missing in some manuscripts), but the question of how they came into existence is also added. However, the subject of this final addition, which is parallel to ch. 2.4 (and ch. 2.6) on the cosmos, only plays a minor role in the chapter. It is not a second question that allows contrasts between the major divisions of opinion, as in ch. 2.3. The preference should be given, we believe, to the heading in E without the final addition. The final part of P^B's heading may well have been added on the basis of some of the doxai's contents (esp. P2–3–4–7). The heading itself poses the question in the category of substance. See our discussion on A 2.11 Commentary C, where we list the parallel headings in Book 2 and elsewhere.

D *Analysis*

a Context

The chapter on the nature of the stars is the second of the five major οὐσία chapters spread throughout chs. 2.11–32 and Book 3; see further above on ch. 2.11. The section 2.13–19 covers questions relating to the heavenly bodies. It should be noted that A appears to use the terms ἄστρον and ἀστήρ interchangeably (the former in chs. 2.13 and 18, the latter in chs. 2.14–17 and 19; but note how confused the witnesses are on the title of the present chapter). In this he differs from Ach who devotes a chapter to distinguishing between the two (§14, τί μὲν ἀστήρ, τί δὲ ἄστρον). To avoid ambiguity we shall translate ‘heavenly bodies’ when both stars and planets are meant (in the present chapter even meteorites are included).

On the possibility that there may have been a lost chapter on the subject of whether the heavenly bodies are alive or not, as suggested by a quaestio given as an example in Book 1.proœm. 3[15], see the Commentary ad loc. A(3).

b Number–Order of Lemmata

There is no material in P and T that is not found in the fullest source S. It is very likely therefore that the record of the chapter in S is complete. Given S's method, using this chapter as his basis and adding material from the next six chapters, it is also probable that for the most part he accurately reflects the order of the lemmata in A. In attempting to determine the original form of the chapter, however, three problems arise.

(1) For Empedocles P has two separate doxai (P2 and P5), which in S are kept together, joined by a simple καί (S2ab). As Bottler (2014) 368 rightly points out, the conjunction is an indicator of the process of coalescence. S more commonly uses the word δέ, but this was not possible here because of the μὲν ... δέ construction in the second doxa (another example of καί solving the same problem is found at in the same chapter at S 1.24.1e for the coalesced doxai of Democritus). It is of course not unusual in A to have two doxai with the same name-label in a single chapter (see the discussion at M–R 2.2.523). The second doxa in P admittedly does not have a close connection with the subject matter of the chapter. A more natural location would have been in ch. 2.15 on the ordering of the stars, but to move it there, given its presence in P 2.13, would be too radical a step. So, contrary to our view in M–R 2.460–461, we now believe that the separation of the two doxai, as set out in P, should be retained. As for the position of the second Empedocles doxa in the chapter, it is plausible to retain P's order and so place it between Diogenes' second doxa and Plato. We agree with Diels that, given the tight connection between Diogenes' doxa and that of Anaximenes (both speak of invisible stones or bodies), it should be placed after the latter doxa, so immediately preceding the view of Plato.

(2) There is a small discrepancy in the order of the lemmata between S and T that needs to be resolved. The lemma recording the view of Democritus follows that of Diogenes in S, but in T the order is reversed. Here we do not follow Diels, who gives priority to T above S. It is true that both the previous lemma of Anaxagoras (§3) and that of Democritus speak of ‘rocks’. T recognises this link with his formula καὶ Δημόκριτος δὲ τοῦτον κρατύνει τὸν λόγον (A 4.17.3). But in our view it remains more likely that S followed his method consistently and so Diogenes would have preceded Democritus. There are other examples of T reversing the order of two doxai, e.g. at A 4.5.8–9. The difference between the two solutions, however, is not great. As we shall see, both doxai belong to the same group of thinkers on the question at issue.

(3) In the case of Diogenes we also have two doxai connected to the same name-label. This time they are both joined together in S and P, but in T they are separate. The formula introducing the second doxa in P is striking. The words πάλιν δ’ ὁ αὐτός may be taken as an indication that the epitomator has linked up two originally separate lemmata (it is the only instance in P that this formula is used for a name-label; for πάλιν introducing an additional point cf. A 1.3.7[58]). Given S’s method in this chapter, it is likely that he too coalesces here. So we must conclude that in this case there were two Diogenes doxai in the chapter. But the location of the second still remains uncertain. From P and T we can deduce that it came after Anaximander and before Plato. Diels placed it after Parmenides–Heraclitus, but before Anaximenes. As will emerge below, it is more probable that it came *after* the Anaximenes doxa. As supporting evidence for the hypothesis that there were two Diogenes doxai in the chapter it should be noted that P skipped all the lemmata in A between the two. This was a very obvious and easy method of abridgement that was available to him. He simply linked up the two doxai, thereby leaving out the four or five lemmata in between.

c Rationale–Structure of Chapter

Because of its length, the chapter’s structure is not as neat and clear-cut as that of many others. Nevertheless it is clear that its main contours are determined by a fundamental diaeresis between the view that the stars consist of a basically earthy, rock-like substance (which is enflamed so that they are mostly visible) and a purer fiery or ethereal substance. This division is not found in Aristotle in his discussion on the nature of the stars in *Cael.* 2.7, presumably because it was too far removed from his own view. But it is very clearly found as the basis of Seneca’s discussion of the subject in *Nat.* Book 7 (text below section E(a) General texts). The same diaeresis is also found in Philo, Achilles and Isidore of Pelusium (cf. section B above). The chapter also reveals a general movement

from the first to the second pole of the diaeresis. At the end, as often elsewhere, a number of additional themes are included. The chapter thus proceeds as follows.

(1) The chapter begins with Thales, ἀρχηγέτης of the Italian succession, who represents the ‘earthy but inflamed’ view without further detail (§1). But he is immediately followed by Empedocles (§2), whose doxa belongs to the ‘fiery’ group (note that the verb ἐξαναθλίβω anticipates the πιλύματα introduced in §7). It may be surmised that A wishes to set out the basic antithesis at the outset (the same procedure, as we shall see below, in Ach). T prefers to retain continuity in his listing, and so passes over the Empedoclean lemma.

(2) The next four doxai (§§3–6) revert to the ‘earthy’ view: the stars are lumps of red-hot rock or iron. In the case of Diogenes they are like sponges, not (presumably) because they are soft, but because they have openings that allow the fiery pneuma to circulate.

(3) A continues with two doxai that regard the stars as ‘compressions’ of air and/of fire (§§7–8).

(4) Diels now followed with the second Diogenean lemma, but the transition is needlessly harsh. If Anaximenes (§9) follows, as in S, then the sequence of fiery doxai is maintained. But an interesting addition is made: there are also invisible rocky bodies carried around with the heavenly bodies, i.e. meteorites. This view thus combines the two poles of the diaeresis. A then recalls that Diogenes also mentions such invisible bodies. This time, however, they are invisible when whirling in the heavens, but can be observed when they fall down to earth (§10). The double use of the verb συμπεριφέρω links up the two doxai, as Diels *DG* 67 saw, with a contrast between the two doxai introduced with δέ in the second part of the sentence. It is also to be agreed with Diels that the δέ after Diogenes’ name in S was probably introduced by the anthologist as often elsewhere; the same particle is found in T, but cannot tip the balance because he leaves out §§8–9.

(5) There follows the second Empedocles lemma (§11) which distinguishes between the positioning of the fixed stars and the planets, the former having been fixed to the crystalline heaven, the latter free to move. As noted above, the view seems out of place here, but its position must be retained because of the location in P.

(6) The next three views continue the ‘fiery’ group (§12–14). Plato’s view, based on *Tim.* 40a, is distinctive and by implication includes some earth in the stars’ composition. Aristotle’s theory of the quintessence is a reaction against it. Xenophanes’ fantastical theory comes last in the group, presumably because of its unusual nature.

(7) Two doxai remain. That of Heraclides and the Pythagoreans (§15) is also unusual and can be regarded as an additional ‘interesting’ view, but in a sense it continues the compromise between ‘earthy’ and ‘fiery’ views. The explicit reference to the Orphics is unique in the *Placita*, but see A 2.2 Commentary D(e) on additional material in Ach that is probably drawn from the *Placita* tradition. The final doxa (§16) is another affirmation of Epicurus’ ‘modal’ view, which rejects all diaereses in favour of τὸ ἐνδεχόμενον. The same view, terminology and final placement were found at 2.2.5; see further A 2.2 Commentary D(c). The term goes back to Epicurus himself (*Ep.Pyth.* at D.L. 10.88). At D.L. 10.90, however, he indicates that the heavenly bodies may be pneumatic or fiery or both, but does not emphasize the ἐνδεχόμενον. It seems more likely that here it refers to all the various views represented in the chapter, rather than qualifying just the previous doxa, as suggested by Lachenaud (1993) 112 n. 4.

d Further Comments

Individual Points

§2 In this and the following doxa cosmogonic elements are added to the cosmological theme of the chapter. Some details of Empedocles’ view recall the description of the cosmogonic process attributed to him in A 2.6.3. The further details in §11 may also originally be derived from a cosmogonic account.

§3 Confusion between the terms ἀήρ and αἰθήρ in the various grammatical cases is frequent in the manuscripts of the P tradition and also in S. For other examples see §14 below, A 2.6.3, 2.7.5 etc. Here there can be little doubt that αἰθήρ is meant. Other texts do not mention that the stony heavenly bodies are swept up from the earth, as maintained here.

§§9–10 The doxai attributed to Anaximenes and Diogenes share similarities with that of Anaxagoras, who was famous for his prediction of the fall of the meteorite at Aegospotami in 467 BCE. In the case of Anaximenes there has been much discussion on how the various reports on the origin and nature of the heavenly body can be harmonised; cf. Wöhrle (1993) 70–72. The evidence of Hippolytus, however, throws interesting light on A’s doxai. The correspondences between his doxa on Anaxagoras and A’s on Anaximenes seem to be too great to be coincidental, so that there is much to be said for the view of Kirk-Raven-Schofield that Anaximenes’ doxa here is a case of ‘the inaccuracy of doxographical attributions’ (1983, 156). Since this is the only case in the testimonia to Diogenes that there is mention of the fall of the meteorite, there may have been transference in the case of his doxa too. But of course he may well have referred to it in his discussion of the nature of the heavenly bodies.

§10 Laks (2008) 206 argues that πίπτοντα in S may well be deliberate, referring to the term ἄστρα and indicating that meteorites too are heavenly bodies.

He retains, however, the reading *πίπτοντας* for P. We have to choose. The proximity to *λίθους* makes the latter reading much more probable.

§11 The description of the outer heaven as ‘crystalline’ is consistent with the Empedocles doxa at A 2.11.2. On the attribution of the same view to Anaximenes with the additional image of studs at 2.14.3 see our note at ch. 2.14 Commentary D(d).

§12 The Platonic doxa is ultimately derived from *Tim.* 40a2–3, τοῦ μὲν οὖν θείου τὴν πλείστην ιδέαν ἐκ πυρὸς ἀπηργάζετο, as is the case for the parallel doxai at A 2.20.7 and 2.25.7. Plato’s statement covers the entire γένος of heavenly beings. The doxographical tradition has applied it to the various individual cases. The doxography at D.L. 3.74 follows the Platonic source more closely. Interestingly A adds an explanatory metaphor: the additional inclusion of the other elements binds together the heavenly bodies (as we may assume) in the manner of glue. Plato himself does not use the metaphor in this context, reserving it for aspects of human physiology (*Tim.* 43a, 75d, 82d). Aristotle *Mete.* 4.4 382a1 notes the role of glue in Empedocles’ physics (cf. 31A34 DK), but applies it to sublunary compounds, not the heavenly bodies. We note that both S and T leave out this extra information, perhaps independently recognising its non-Platonic nature. It is theoretically possible that it was added by P, but it would go against his usual practice as epitomator.

§13 Translation and interpretation of this lemma is based on Mourelatos’ careful analysis in (2008) 139–146. He argues that *πεπυρωμένον* means ‘incandescent’ and not ‘ignited, enflamed’, i.e. does not necessarily imply that the composition of the stars is itself fire.

§15 There is much variation in the witnesses with regard to the composition of the mini-worlds of each heavenly body (i.e. planet), exacerbated by the similarity of the terms *ἄήρ* and *αιθήρ*. Given the correspondence of S and T, we think it best to follow the suggestion of Diels *DG* 343 in the apparatus that their readings best reflect the original in A, regardless of all the variation shown in the tradition of P. Though Heraclides and the Pythagoreans are not associated with the group of infinitists in A 2.1.3 (Pythagoras is regarded as a unicist in 2.1.2), the doxographer may assume that an infinite expanse of aether is implied by Heraclides’ hypothesis that the earth turns around its axis while the heaven remains at rest (3.13.3). Gottschalk (1980) 82–83 argues that Heraclides espouses the view that the cosmos is infinite in extent with the moon and the stars each forming a complete world. More recently Keyser (2009) 212 concurs, but in the view of Todd–Bowen (2009) 179 it cannot be proven. Note that at A 3.13.3 Heraclides is associated with Ecphantus ὁ Πυθαγόρειος (though with the Pythagorean Hicetas at Cicero *Luc.* 123). T’s formulation *ἄλλοι τῶν Πυθαγο-*

ρείων τινές may imply that he regards Heraclides as a Pythagorean, but does not necessarily do so (cf. Smyth 1956, §1272). In their recent edition Schütrumpf et al. (2008) laboriously treat ^PBEG, S and T in five separate lemmata (fr. 75A–E). But our method constrains us to make a choice for a single text.

e Other Evidence

Ach's chapter (§11) entitled Τίς οὐσία ἀστέρων forms a remarkably close parallel to our chapter. Indeed it was the closeness to P in this case that was a prime reason for Diels to postulate (erroneously) that Ach had excerpted P (see the discussion with a useful comparison in two columns at *DG* 24). The first six lemmata correspond to P1–2–3–4–6–7; only the seventh with the name-label Stoics is not found in P or A. The first two doxai preserve the basic diaeresis just as in A, emphasizing it even more with a μέν ... δέ construction. The Anaxagorean doxa is introduced by the word τινές ... ἐτόλμησαν, which can have a neutral connotation (i.e. 'claimed'), but in this context perhaps hints at a contrast with the Stoic view in the final lemma that the stars consist of divine fire. Such theological concerns are mostly foreign to the method of the *Placita* (compare also Philo *Aet.* 47 cited below, where the attitude towards Anaxagoras is openly hostile). The phrase μετὰ τὴν πρώτην διάκρισιν is almost the same as in A, but there it is part of the Empedoclean doxa. The fourth doxa is presented anonymously, but clearly corresponds to the first part of the Diogenean lemma in A. Nothing in our witnesses to A corresponds to the Stoic lemma. It may have been part of an earlier *Placita* tradition, but then it would be surprising that A did not include it in some form or other. It is possible that Ach imported it from another source. Another possibility, however, is that it does reflect a Stoic doxa that was present in A, but was omitted by P and T and not copied out by S because he replaced it with material from AD fr. 32 Diels at 1.24.5 (Posidonius, Chrysippus and Apollodorus). However this may be, it is certainly remarkable that the first six doxai all correspond to those in P, without any of the extra material preserved by S or T. Nevertheless, as Diels later saw (see Pasquali 1910, 221), they cannot be viewed as derived from P. They represent the shared tradition of the *Placita*.

Commentary

A *Witnesses*

(1) P and his tradition (including G) have four lemmata (the second is passed over by Eusebius). G does not include the chapter heading, so it seems that his four lemmata become part of the previous chapter. Jas argues (2018a, 183) that this may have been his intention and does not include these doxai as a separate chapter. However, for the sake of clarity we have retained the numbering of Diels (ch. 56a).

(2) In the grand process of coalescence carried out by S (see above on ch. 2.13), three doxai are included, but the last anonymous lemma recorded by P finds no place, as occurs more often in S (see M–R 1.235).

(3) T retains only the first two doxai with their clear antithesis.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* There are remarkably few references to this question in the proximate tradition. Philo does not include it in his long list of questions on the heaven and the heavenly bodies. It is briefly included in Diogenes Laertius' doxography of the Stoa, but it is not found in the fragments of Arius Didymus. Many centuries later Isidore of Pelusium, in his text on the nature of the stars (discussed on ch. 2.13), includes three doxai that mention their shape—*πύρινοι σφαίραι, δισκοειδῆ σώματα, σφαιροειδεῖς πυρὸς πιλῆσεις*—, of which the second is not found in our chapter. Isidore must have had access to a doxographical tradition differing from but parallel to that utilised by A. Much closer to A, however, is the brief chapter in Achilles with the heading *Περὶ σχήματος ἀστέρων*, which will be analysed separately below in D(e).

(2) *Sources.* In the *Timaeus* Plato does not mention the shape of the heavenly bodies, in contrast to the that of the universe as a whole. Aristotle, in his treatment of the stars in *Cael.* 2.8, states his view that they are *σφαιροειδῆ* (the usual term in A, cf. 2.2.1, 2.22.3 etc., but in this chapter the term used is *σφαιρικός*). He adds that this is also the view of others (text below section E(b) General texts). But, apart from this passage (and references to it in the commentators), the topic of the stars' shape occurs but seldom. It not specifically mentioned in the cosmological treatise of the Stoic Cleomedes nor in Geminus' handbook of astronomy. Clearly from the 4th century BCE onwards the stars' spherical shape was generally assumed, with as striking (and perhaps suspicious) exception Cleanthes. It might be expected that in the atomist tradition at least the possibility of different shapes would have been raised, but if so, we have not found any evidence of it.

C *Chapter Heading*

The heading follows the predominant umbrella Περί x construction, reflecting a quaestio in the category of quality (well understood by Ps in using the unusual interrogative adjective ποταπός). The majority reading of the plural σχημάτων is to be preferred above the singular σχήματος in E and one ms. of P^B (and Ach). The singular suits the cases of the cosmos (ch. 2.2), sun (2.22), moon (2.27) and earth (3.10) better, but the plural is clearly more suitable for the vast number of stars and planets.

In his chapter 1.24 on the heavenly bodies S adroitly combines the headings of chs. 2.13, 2.14, 2.16 and 2.19. A consequence, however, is that he omits the headings of three chapters from which he does include excerpts, chs. 2.15 (on τάξις), 2.17 (on their illumination) and 2.18 (on the Dioscuri).

D *Analysis*

a Context

The question of shape in the category of quality follows on from that of nature or essence, as in the case of the cosmos (ch. 2.2), sun (2.22), moon (2.27) and earth (3.10). A chooses not to pose the question of size in the case of the stars, in contrast to that of the sun (2.21) and moon (2.26). This would have been scarcely possible in the context of ancient astronomy.

b Number–Order of Lemmata

Among the witnesses for A there is no evidence for any more lemmata than are found in P, so the chapter may be regarded as complete (but see below D(e) on Ach). For the order of the doxai we can also rely on P, since the deviation in S is easily explained by the process of coalescence.

c Rationale–Structure of Chapter

The chapter as transmitted divides into two pairs of contrasting doxai, only the first of which is exploited by T. This first pair gives two different shapes. The Stoa is taken to represent the dominant view (implied in the comparison with other bodies; the same choice of name-label occurs in chs. 2.2, 2.27 and 3.10). The doxographer then points out a disagreement within the school itself (unlike in 2.2, where the cone-like option is kept anonymous, it is attributed here specifically to Cleanthes). The contrast involved in the second pair of doxai is less explicitly indicated. The stars are either stuck to the crystalline nature of the outer heaven (already ascribed to Empedocles, but here to the earlier Anaximenes) like studs (perhaps the image of a shield), or they are flat leaves like drawn or painted representation of living things (to draw out the full implication of the term ζωγράφημα). The parallel text in Ach suggests that the contrast

turns on the difference between two and three-dimensional shape, the studs having—we may surmise—a semi-circular shape. His second doxa states that ‘some thinkers say they (sc. the stars) resemble inflamed leaves having no depth but are like pictures’ (text *Testes secundi* above). A similar contrast is made at the beginning of the next ch. 2.15 on whether the stars are disposed on a flat surface or three-dimensionally with height or depth. The terminology of ‘being fixed to’ or ‘bound to’ the outer heaven used by A at §3 and previously 2.13.10 is found in numerous authors, examples of which are given below. In a much later text at *Enn.* 2.3.7.4 Plotinus uses the image of ‘pictures written in the heaven’ to describe the stars, but in this case he would not deny that the stars were spherical; they appear to be pictures in the form of the well-known constellations.

d Further Comments
Individual Points

§§1–2 There are divergences between P and ST in the first name-label and in the use of the μέν ... δέ construction. The opposition between ‘the Stoics’ and Cleanthes (as in P) may seem strange, because Cleanthes is a Stoic himself (cf. the conjecture of Diels and Wachsmuth for the text in S, οἱ μέν ἄλλοι (Στωϊκοί)). This may be the reason that both S and T dropped the reference to the Stoics. But we observe that the same kind of antithesis is made in ch. 2.9 (Stoics, Posidonius). And as noted above, the Stoics have the prime place in the equivalent chapters on shape at chs. 2.2, 2.27 and 3.10. The reading of P should be retained as the *lectio difficilior*. Similarly with regard to the use of the μέν ... δέ construction we have chosen the more difficult reading. It is more likely that it was introduced by the paraphrasing activities of ST than that it was deleted by P.

§2 Cleanthes’ idiosyncratic view that the stars have a cone-like shape will be linked to his view that it is the shape of the element fire (A 1.14.5), and may perhaps also be connected with the optical theory that the visual rays form a cone, attributed to Chrysippus at A 4.15.3. See further the discussion in the Commentary on ch. 1.14.5. Gilbert (1907) 691 cited by Lachenaud ad loc. surmises that the view is based on the fact that the appearance of fire in a flame is conical in shape. Von Arnim (1921) 565 appeals to his view of the moon’s hat-like shape in A 2.27.4 and suspects the influence of Heraclitus’ bowls (cf. the previous doxa in the same chapter 2.27.3, and also 2.28.7).

§§3–4 There has been much speculation on this text, because elsewhere it is the second view that appears to correspond to Anaximenes’ view and not the first (note the reference to the sun as πέταλον at 2.22.1, which Diels VS 1.95 regarded as drawn from Anaximenes’ original text; Ach keeps the doxa

anonymous, so cannot help us). See discussions in Guthrie (1962–1981) 1.135, Lloyd (1966) 317, Kirk–Raven–Schofield (1983) 155; further references at Lachenaud (1993) 248. Brind’Amour (1969) somewhat naively suggests that the name-labels be reversed. Long ago Heath (1913) 41–43 proposed that ἔνιοι be emended to ἐνίους, so that the distinction would occur within the Anaximenean doxa (Guthrie’s grammatical objection to this only follows if the reading of S is preferred as in DK). Schwabl (1966), supported by Wöhrle (1993) 72, proposed that the words ἔνιοι δὲ πέταλα εἶναι πύρινα be regarded as a comment on the planets that has found its way into the text on the fixed stars. Recently too, Bottler (2014) 375 and Couprie (2018) 50 n. 16 agree that the second lemma fits in better with Anaximenes. It is true that a mix-up of name-labels or views may quite easily have occurred, e.g. if the Anaximenes doxa originally belonged to Empedocles (cf. his doxa at A 2.13.2) and the other doxa to Anaximenes (suggested by Lloyd and Kirk–Raven–Schofield). But it would go too far to emend the text as transmitted in our witnesses.

e Other Evidence

Ach has a chapter with an identical title. The similarities to A cannot be coincidental and point to a shared tradition. He and A are ‘cousin writings’, cf. M–R 1.305. Three of A’s doxai can be easily recognized, but in a different order: Ach₁ = §2, Ach₂ = §4, Ach₄ = §1. Anaximenes’ doxa is not found and an additional pyramidal shape is included (reminiscent of the studs in A’s §3, since a body with pyramidal shape can be stuck onto a virtually flat surface). As noted above in section D(c), Ach’s reference to two-dimensional shape may give the clue to the second diaeresis in A. Ach’s chapter has a different organization, seeming to work towards the final view as definitive (the contrast within the Stoic school is thus not exploited). Isidore of Pelusium in his passage on the heavenly bodies discussed above on ch. 2.13 also mixes in the question of shape, but his ‘like a disc’ alternative does not occur in A or Ach (it is found in A 2.27.5 on the moon and 3.10.5 on the earth). His text, in referring to τὰ ἄστρα, may of course be referring to planets as well as fixed stars.

Commentary

A *Witnesses*

(1) Six doxai are preserved in the Byzantine mss. of P. The same six are found in E and Q with some interesting textual variants to be discussed below. G leaves out the second and last lemma in his adaptation. Some formulations in Ps recall the contents of this chapter, but they are of no textual significance.

(2) S has retained all six of the doxai in P, but his preferred method scatters them to five different locations in his ch. 1.24 on the heavenly bodies (on the method used in this chapter see further M–R 1.220–223). He begins by placing doxai attributed to Democritus and Anaximander (cf. P3 & 6) in clusters based on the order of the lemmata in 2.13. This method constrains him to split up the equivalent of P6 into separate doxai for Anaximander and Metrodorus (while Crates falls away entirely), resulting in an additional lemma (24.1h): Μητρόδωρος ὁμοίως περὶ σχήματος τῶν ἀστέρων καὶ αὐτὸς ἀπεφύηνατο. The reference to the *shape* of the stars is of course a mistake (it should be their *order*), while the final three words are clearly added to facilitate the splitting up of the original doxa. Diels at first missed this and wrongly printed the lemma as part of ch. 2.14, but later he noted his error in the Addenda (DG 853). The Platonic doxa (cf. P4) is also part of a cluster, but thereafter three other doxai are written out separately once the name-labels in ch. 2.13 have been exhausted (cf. P1–2–5). A final lemma that remains is S8 attributed to Parmenides. There can be little doubt that it originally belonged to ch. 2.15 and its placement by S strongly suggests that it came last in the chapter.

(3) This chapter is not utilised by T.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The question of whether the outer heaven with its fixed stars has depth or is just a surface is raised by Philo at *Somn.* 1.21 as part of the extended doxographical passage already discussed on ch. 2.11. The view of Chrysippus on the subject is also given by AD in his Stoic doxography; see the comment below in section D(d) on §2. In the case of Democritus (§3), Anaximander (§6) and Parmenides (§7) information close to what we found in A is given by the proximate sources Diogenes Laertius and Hippolytus (texts below section E(a)). The text on Anaximander at Hippolytus *Ref.* 1.6.5 even shows verbal parallels to A's doxa (though the text is defective). This shows A's dependence on the prior doxographical tradition, but its ultimate source cannot be determined.

Many texts refer to the difference of opinion on the order of the planets below Mars, both in general treatments of physical astronomy and more specifically in comments on the Platonic texts. In a rare doxographical comment Ptolemy says that the matter remains unresolved (text below section E(a) General texts). In the proximate tradition the most important text is found in Ach, who gives more alternative orders than A. On this passage see below D(e).

(2) *Sources.* Discussion of the ordering of the heavenly bodies, whether the fixed stars or the planets taken on their own, or all of them taken together, goes back to the earliest period of Greek philosophy. A few later texts refer to the question of how the fixed stars are placed in the outermost sphere of heaven, for example Cicero's passage on the location of the 'so-called fixed stars' (*stel-lae quae inerrantes vocantur*) at *ND* 2.54–55 and some texts in the proximate tradition to be discussed below. However, from the time of Plato onwards most of the discussion focuses on the order of the seven planets. Plato in the *Timaeus* and more obliquely in the myth of Er in the *Republic* adopts the so-called Pythagorean order, but this loses favour from about 200 BCE onwards (see the note on §§4–5 below). Aristotle in *Cael.* 2.10 291a29–32 mentions the question of the order of the heavenly bodies (i.e. planets) but does not treat it, stating that it can best be studied in writings on astronomy.

In an important comment on Aristotle's text Simplicius tells us that Eudemus in his work on astronomy—its title was probably *Ἰστορία ἀστρολογική*, best translated as *Research on astronomy*, see Mejer (2002) 245—stated that Anaximander was the first to make discoveries on the sizes and distances of the heavenly bodies (but no details given), but added that the Pythagoreans first established the order of their placement (text below section E(b) General texts). Views on the method used in this work differ: see Mejer cited above; Bowen (2002); Zhmud (2006) 228–276. In an examination of the evidence relating to cosmic distances, Mansfeld (2000b) 201 argues that the information in

the *Placita* may ultimately derive from Eudemus rather than Theophrastus, as postulated by Diels and since then followed by most scholars; see further on ch. 2.31 Commentary B.

C Chapter Heading

The chapter's title is of the usual umbrella type Περί x, parallel to ch. 2.7 on the order (τάξις) of the cosmos and ch. 3.11 on the placement (θέσις) of the earth. As we shall see below, the text itself indicates that the subject falls under the Aristotelian category of relative position (κείμενοι). There can be no doubt that the heading of the Byzantine mss., supported by E and Q, is correct. G's shorter heading is seemingly incomplete, the fact that the order concerned refers to the heavenly bodies only emerging from the context (the same occurs in §45 Περί σχήματος sc. κόσμου, and cf. also §54 Περί οὐρανοῦ sc. οὐσίας). It is possible that this rests on a mistake in transmission; cf. our remarks on the heading of G ch. 68 in the Commentary on ch. 2.27. S does not take up this heading in his chapter heading which combines the headings of chs. 2.13–19. The key term τάξις occurs in numerous texts from Aristotle onwards; see the texts cited below in section E(b). An alternative term indicating the question of position is θέσις, as in ps.Arist. *De mundo* and Theon of Smyrna cited below section E(b) §§4–5.

D Analysis

a Context

The chapter occurs as third in the sequence of questions relating to the heavenly bodies, following on the chapter on their shapes. There are no chapters on their number or origin, i.e. parallel to chs. 2.1 and 2.6 on the cosmos, or on their size, i.e. parallel to chs. 2.21 on the sun and 2.26 on the moon. The first two might have been possible, the third was beyond the capability of ancient astronomy. Because of the heavenly bodies' evident plurality, the way that they are ordered must be a question that has to be answered.

b Number–Order of Lemmata

Given the thoroughness of S's excerpting in his ch. 1.24, there is no reason to think that the chapter as we have it with its seven doxai is not complete (S has eight because, as noted above, he splits one doxa into two). The order found in P can also be provisionally accepted, with the final doxa in S added at the end. But it has to be confirmed by an analysis of the chapter's contents.

c Rationale–Structure of Chapter

The chapter very clearly falls into two distinct parts. In the first two doxai the disposition of the ἀστέρεις is discussed. This subject follows on quite naturally

from ch. 2.13–14 and particularly from the distinctions already made in the Empedocles doxa at 2.13.10. The question is whether the fixed stars (this has to be meaning of ἀστέρες in the first doxa) are all situated in a single plane or whether they are situated in a three-dimensional array (a straightforward diaeresis). The extract from the Philonic doxography confirms this, even if it focuses on the outer sphere and not the stars in it (note the terms ἐπιφάνεια and βάθος). We may also compare the question raised by Seneca and Lactantius (texts below section E(a)§§1–2) in their set of quaestiones on the celestial realm as to whether the heavenly bodies were positioned below the outer sphere or fixed in it. There is also a more subtle link with the second diaeresis in A 2.14.3–4, where the studs need three planes but the pictures only two.

But, it must be noted, in the first doxa there is a significant textual problem. Should the verb be κινεῖσθαι as in P or κείσθαι as in S? Preference must clearly be given to the latter. Movement is the subject of the following chapter 2.16, Περὶ τῆς τῶν ἀστέρων φορᾶς καὶ κινήσεως. The present chapter discusses position or order. The verb κείσθαι points to one of the Aristotelian categories (in this case relative position), which are crucial for the way that A orders his material in this book. Interestingly exactly the same textual problem occurs in Aristotle *Cael.* 2.10 291a30, where κείται is also to be preferred. Further support for this reading is the example of the order of the planets given by Alexander to illustrate the comparative question κατὰ τὸ κείσθαι (text below section E(b)§§4–5).

The five remaining doxai that make up the rest of the chapter take as their starting point—clearly articulated in the third doxa—the distinction between fixed stars (τὰ ἀπλανῆ) and the planets (οἱ πλανήτες). The first three postulate that the fixed stars come first, i.e. placed on the outermost part of heaven, followed by the planets in three different sequences, with variations on the order of Venus and Mercury in relation to the sun. The second and third of these of course represent the two main views in ancient cosmology, with the first Democritean doxa as a strange variant (see below on §3). It is surprising that not more prominence is given to the so-called Chaldean order (on which see further the note below, section D(d)§§4–5) which by the time that A compiled his compendium was the majority view. It is presented as an alternative view of ‘some of the astronomers’.

Finally, the last two doxai have some of the planets first, followed by the fixed stars and other planets. These two doxai, which can be taken to represent unusual or even ‘dissident’ views (cf. Laks 1997, 258), form an implicit diaeresis with the previous group.

d Further Comments

Individual Points

§1 The name-label in G, Xenophanes, if not a mistake in transmission, is no doubt a *Verschlimmbesserung*, the epitomator having noticed that in this book A usually begins his chapters with one of the very ancient philosophers, e.g. Thales or Anaximander or Pythagoras. Xenophanes is placed first in chs. 2.18 and 2.28, second in ch. 2.20. His name-label occurs 12 times in Book 2, whereas that of Xenocrates occurs only here. The text at Geminus 1.23 may indicate that the question was still debated in the first cent. BCE, although it remains controversial whether ἀστέρες refers to fixed stars or planets; see the note at Evans–Berggren (2006) 118. As Manitius (1898) ad loc. points out, the difference in height and depth is implied at Manilius 1.394 (but Goold 1977 ad loc. regards the view as foreign to the poet and, following Housman, rejects the line).

§2 The phrase οἱ ἄλλοι Στωικοί does not have to imply that A thinks Xenocrates was a (proto-)Stoic (though it is implied at 1.7.21). As Mras notes at Eus. *PE* 15.46.2, it can be explained by the common Greek idiom used e.g. by Plato at *Resp.* 473d, εὐδαιμονιζόμενος ὑπὸ τῶν πολιτῶν καὶ τῶν ἄλλων ξένων. The usage here, however, must be considered somewhat awkward when used for a *contrastive* rather than an *appositive* group (ἄλλοι in this idiom basically means ‘besides’; cf. Smyth 1956, §1272). The report on Chrysippus at AD fr. 31 states that the fixed stars (τὰ ἀπλανῆ) are all located on the same surface, in contrast to the planets (text below section E(a)§2).

§3 Democritus’ view is oddly phrased. The impression is given that the sun, Venus and the moon are not planets. In addition the placement of Venus in between the sun and moon without Mercury hardly makes sense. Both S and G in different ways edit the text so that it presents a more conventional view. S simply omits the entire final phrase. G also adopts an easy solution by deleting the reference to Venus. Taking our cue from G we might indeed wonder whether the text originally read something like Δημόκριτος τὰ μὲν ἀπλανῆ πρῶτον, μετὰ δὲ ταῦτα τοὺς ⟨ε᾽⟩ πλανήτας, ἐφ’ οἷς ἥλιον {φωσφόρον} σελήνην (the phrase ‘the five planets’ is very common, cf. ps.Eudoxus *Papyrus Parisinus* 1 col. 7.5 and our conjecture at A 2.7.6). It is, however, as Gerard Journée has reminded us, hard to imagine why anyone would introduce Venus into this list in between the sun and the moon. The reading of P (confirmed by the early witness E) is clearly the *lectio difficilior*. It should be noted that in the report of Alexander cited below the planets are listed as five in number in an order (if such is meant) that is also idiosyncratic (Saturn Jupiter Venus Mars Mercury). As in A, the sun and the moon are excluded from the list of planets, but Venus is included.

§§4–5 These two doxai present the classic opposition between the Pythagorean–Platonic order of the planets (sun and moon second last and last) and

the Chaldean order (sun in the middle of the seven followed by Venus, Mercury and the moon). Plato's view is given at *Tim.* 38d, but in less detail than we have here. Like other accounts in ps.Arist. *De mundo*, Geminus and Cleomedes, A is careful to give both the mythological and phenomenological names (the latter, i.e. Φαίνων, Φαέθων, Πυροεῖς and Στίλβων are post-Platonic). The μαθηματικοί (i.e. astronomers) are described as split between the two views. In fact from 200 BCE the Chaldean view gradually takes over. The division of opinion is much more clearly presented by Macrobius and Proclus in their commentaries on Cicero and Plato (texts below, section E(b))§§4–5).

The reading ἐωσφόρον for the planet Venus, which is found in P^B, E and S, agrees with the Platonic text in *Tim.* 38d2 and must be preferred to the variant φωσφόρον in G and Q. It should be noted that the latter term was the more usual title and it has crept into the text of Middle Platonic writers such as Timaeus Locrus and Alcinoüs; see Dillon (1993) 131.

§6 It is surprising to see Anaximander joined by two much later figures. Certainly in the case of Crates of Mallos, an important commentator on Homer (first half of second cent. BCE), it is likely that a report on Anaximander has been mistaken for his own view.

e Other Evidence

Ach's chapter Τάξις τῶν ζ' σφαιρῶν has a very different kind of title, but does show some similarities to A. The four doxai are presented anonymously and only consider the order of the planets, not the fixed stars. He appears to combine two sources, the first a straight handbook giving the generally accepted Chaldean order (for οἱ περὶ τὰ μετέωρα δεινοί cf. the μαθηματικοί in A). He then cites three doxai giving alternative views, with some resemblance to the doxai in A. After citing a famous Empedoclean verse on the moon not used by A, Ach links it to the subject of the planets' motion, which A broaches in his next chapter 2.16.

Commentary

A Witnesses

(1) In the Byzantine mss. of P we find five lemmata, of which the first four clearly constitute two linked pairs. G omits the second pair, and so has only three doxai. In the case of P2 and P4 important variants in E (partially supported by G and Q) represent a superior tradition. These will be discussed below.

(2) In S the process of coalescing chs. 2.13–19, though systematically and competently carried out (see above on ch. 2.13), starts to get more and more difficult as he moves through the chapters. We note the following:

(a) When at S 1.24.1c he adds the Anaxagorean doxa (= P1) to the one by the same philosopher in 2.13, the other two name-labels recorded by P fall away.

(b) S noted that there are two references to the μαθηματικοί in the chapter (both retained by P). The latter of these is linked to the name-label Plato, just as occurs in the previous chapter. So he coalescences these two doxai in S 1.24.2b. He then adds the former, even though this one does not include the Platonic name-label. But he has an additional problem, because the former lemma also has the name-label of Alcmaeon, so he solves the problem by adding the words τούτῳ δὲ συνομολογεῖ καὶ Ἀλκμαίων (of course it is also theoretically possible that P is the one who coalesced and that S preserves the original, but given the methods of the two witnesses this is much less likely).

(c) The doxa of Anaximander was not included in the coalesced grouping at S 1.24.1g. The most likely and interesting reason for this is that he wanted to preserve the contrast with the preceding Aristotelian doxa and so wrote it out separately.

(d) The final doxa preserved at S 1.25.5 is difficult and will be further discussed in the detailed notes below.

(3) T does not make use of this chapter.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* There is little parallel material in the proximate doxographical tradition. Ach's chapters on the stars (§10) and the planets (§15) are wholly descriptive and not parallel to A, except for a reference to the Pythagoreans, who are said to wish both the planets and the fixed stars to have their own movements (cf. §2 in the present chapter). The Aratean scholia give a more detailed version of §2, but without a name-label. Philo refers to the subject as relevant for the 'investigators of nature' in two texts that very likely show the influence of earlier literature linked somehow to the *Placita*; see above on ch. 2.11 and Runia (2008b) 26. See the texts cited above under *Testes secundi* and below in section E(a).

(2) *Sources.* On Aristotle's references to the topic of the movement of the heavenly bodies as part of his organisation of the treatment of the heavens see our comments on A 2.13. There can be little doubt that the macro-structure of this section of the *Placita* ultimately derives from Aristotle and the Peripatetic school.

More specifically in relation to the present chapter in *Cael.* 2.8 he gives a brief dialectical discussion of the different theoretical possibilities in relation to the movement of the whole heaven and the heavenly bodies (τὰ ἄστρα ... καὶ ὁλος ὁ οὐρανός), but he does not refer to any names of predecessors. In a different context there is a report at *Mete.* 2.1 354a30 about the movement of the sun (not the heavenly bodies in general) that is attributed to the ἀρχαῖοι μετεωρολόγοι. The language is so similar to what we read in §5 on Anaximenes that it is difficult not to conclude that there is some connection between the two texts, i.e. that the *Placita* may be utilising a source which goes back to a fuller text with names of philosophers drawn up in the Peripatetic school or compiled even earlier than Aristotle. In addition similar versions of this doxa occur in Diogenes Laertius' and Hippolytus' accounts of Anaximenes' doctrine, including the comparison with a felt hat (πίλον). As we note below in section D(c), even the language of the doxai shows a link to the earlier Aristotelian treatment.

A little later Epicurus in *Ep.Pyth.* at D.L. 10.92 gives a diaeresis of three positions on the movement of the heavenly bodies. As Mansfeld (1994b) notes, this suggests that he utilised a Peripatetic source (see discussion of this text at M–R 3.248–249). He may have even used *inter alia* a predecessor of the *Placita*, but it should be noted that he lists the various possible causes, which are not emphasized in A's account. A similar diaeresis is given by Lucretius in *DRN* 5.509–533.

The doctrine of §2 that the planets move from west to east along the zodiac circle (and by implication that the fixed stars move in the opposite direction

from east to west) becomes standard doctrine in astronomy from the fourth century BCE onwards. It is much discussed by the astronomers, but not often referred to in philosophical texts. But see below in section E(b) General texts two texts in Alexander and ps.Alexander, the former of which asks for the cause of this phenomenon.

C Chapter Heading

The heading in the Byzantine mss. and Ps may be accepted. It uses the most common formula Περί x and in discussing the question of motion relates its contents to the categories in general (note that there is no separate Aristotelian category of movement; cf. ch. 1.23 Commentary C., where we cite Theophrastus fr. 153B FHS&G at Simp. in *Phys.* 413.5–7). The term φορά has been added to the standard κίνησις (cf. chs. 1.23, 3.13), most likely because of the prominence of the verb φέρεσθαι and its derivatives in the chapter. G removes φορά even though he retains two lemma containing φέρεσθαι and ἀντιφέρεσθαι respectively. E's ἄστρον is the minority reading and should not be taken over (on A's use of ἀστέρες and ἄστρα see above 2.13 Analysis (a)).

In his chapter heading combining chs. 2.13–19 S retains only the noun κινήσεως, omitting the mention of φορά. He will have noted from chs. 1.23 and 3.13 (and perhaps from a chapter in Book 2 missing in P, cf. ch. 2.2 Appendix) that the former is the key term.

D Analysis

a Context

The question of movement follows on naturally from the discussion of the heavenly bodies' placement in ch. 2.15. Compare how ch. 3.13 on the movement of the earth follows ch. 3.11 on its nature (with a chapter on the earth's inclination, cf. chs. 2.8, 2.23) in between.

b Number–Order of Lemmata

Although the methods of our two chief witnesses are very different, there is a good correspondence between their results in this chapter. All of P's material can be found in S, while S has some additions that P has excerpted away. If we understand S's method of coalescence (details discussed above under Witnesses, section A), we can see that P's order can be retained, even though the order that S finishes up with is quite different. It is always possible that in the process of coalescence some unidentifiable material got lost (note what S did with the name-labels in P₁), but it will not have been much.

c Rationale–Structure of Chapter

The chapter appears to string together various subjects, using the doxographer's usual diaeretical and antithetical approach, but in a not very tidy fashion.

(i) The first two lemmata form a clear diaphonia, which in fact amounts to a division between the Presocratic vortex cosmology and the standard post-Platonic cosmology that uses concentric spheres. In the former both fixed stars and planets move in the same direction (but some slower than others), in the latter they have opposed motions.

(ii) The next two doxai also clearly form a pair. As the text stands, the only difference between the two is that Aristotle's heavenly bodies are carried along on the spheres to which they are attached, whereas those of Anaximander are also moved by their circles. This must be a reference to the celebrated circles of fire and their openings (cf. A 2.20.1). It has been claimed that the reference to spheres is out of place and that the doxa can be regarded as a repetition of the previous Aristotelian doxa; see Kahn (1960) 59, Guthrie (1962–1981) 1.93 n. 1. This is to ignore the method of the *Placita* and in any case, it would not have been difficult to envisage his system (anachronistically) in terms of spheres as well as circles; see for example the diagrams in Couprie (1995).

(iii) The formulation οὐχ ὑπὸ τὴν γῆν of the next Anaximenean doxa implies a correction of another view. This is best taken as a critical reference to his predecessor Anaximander. The same doxa is found in doxographical reports in Diogenes Laertius and Hippolytus (texts below section E(a)§5). The verb στρέφεσθαι implies the whirl of the Presocratic vortex, as introduced in §1 (though this view cannot be attributed to Anaximander). This means that the preposition περί cannot mean 'around' in the usual sense of the cosmic revolutions (or for Anaximander circles of fire), but rather 'around' more or less in a plane parallel to the flat earth, dipping below the horizon but not going all the way below the earth. See further below section D(d)§5.

(iv) The view of Plato and the astronomers on the concurrent motion of Venus and Mercury with the sun is a further refinement of the 'modern' view introduced in §2. It is better to place this doxa towards the end of the chapter as in P than link it to the other Platonic–astronomers view as in S. The comment on the identity of the morning and the evening star is to be seen as an appended thought.

(v) The final view adds a comment that ascribes this doxa to the earlier Presocratic Pythagoras. On this lemma see the comments below.

A striking feature of this chapter is the way that it uses verbs and verbal phrases to link up and articulate the various positions:

- §1 φέρεσθαι
- §2 ἀντιφέρεσθαι
- §3 ὑπὸ τῶν σφαιρῶν φέρεσθαι
- §4 ὑπὸ τῶν κύκλων καὶ τῶν σφαιρῶν φέρεσθαι
- §5 στρέφεσθαι
- §6 συμπεριφέρεσθαι

The method gives the chapter a forward momentum, in which there is a combination of antithesis (through the use of the diaeresis) and development (through the use of association). It is worth noting that the key verbs that A uses are all prominent in Aristotle's diaeretic account of heavenly movements in the *De caelo* with the exception of συμπεριφέρεσθαι (but cf. περιφέρεται at 2.2 285b20).

d Further Comments

Individual Points

§1 The addition of the Stoic Cleanthes to the two Presocratics is unexpected and can be linked to other doxai where an unorthodox view is ascribed to Cleanthes (A 2.14.2, 2.27.4).

§2 The shorter version of the text in E, G and S is to be preferred above P^{BQ}. ἐναντίως could easily have been added later and the inserted γάρ is rather awkward.

Coupré (2011) 171 claims that Alcmaeon as a Pythagorean will have subscribed to the hypothesis of a central fire with the earth and the other planets revolving around it. So the present report 'is usually, and perhaps already by its author Aëtius, misunderstood as a description of the contrary movement of the planets along the zodiac as is appropriate in the geocentric system.' This is quite well possible, but we do not know the details of Alcmaeon's cosmology, and anyway our task is to interpret A. See further Burkert (1972) 333–335.

§5 The various textual traditions read as follows:

- P^B Ἀναξιμένης ὁμοίως ὑπὸ τὴν γῆν καὶ περὶ αὐτὴν στρέφεσθαι τοὺς ἀστέρας.
- E Ἀναξιμένης οὐχ ὑπὸ τὴν γῆν περὶ αὐτὴν δὲ στρέφεσθαι τοὺς ἀστέρας.
- S —οὐχ ὑπὸ τὴν γῆν ἀλλὰ δὲ περὶ αὐτὴν στρέφεσθαι τοὺς ἀστέρας.

There can be little doubt that E and S preserve the right reading, particularly since as noted above the same doxa is already anonymously reported in almost exactly the same formulation in Aristotle's *Meteorology*, though he uses the verb φέρεσθαι rather than στρέφεσθαι. In the text we have opted for E. In *DG* and *VS* Diels followed E, but the text in *DK* is closer to S (but omitting δέ).

Our interpretation of the text differs from that put forward by Couprie (2018) 114–119. He argues that Diels' 'emendations' of the text of P have had a malign influence and that the correct text is that of the manuscripts of P. The implication that the original reading in P has some kind of special authority is beside the point, since in fact the evidence in E and S is older than that of the Byzantine mss. of P. Couprie argues (p. 117) the contrast between the two Milesians here is 'that Anaximander regards the heavenly bodies as fixed places of turning wheels, while Anaximenes has in mind fiery bodies (or leaves) floating on air' (the last statement is based on A 2.14.4, which he claims (p. 50) is the true view of Anaximenes and not the one reported with his name-label in 2.14.3). See further Couprie's entire ch. 7 (pp. 99–129) which goes into much more detail than can be discussed in the present context.

§6 P has abridged A, as witnessed by S. The text in S would read better as ἰσοδραμεῖν τῷ ἡλίῳ τὸν ἑωσφόρον καὶ τὸν στίλβοντα καὶ συμπεριφέρεσθαι αὐτῷ, as printed at M–R 2.493, but this degree of intervention in the text is not justifiable in the present edition.

§7 The ascription of this doxa is difficult. Formally it differs from most Aëtian lemmata since it reports on a doxa rather than attributing it directly to the philosopher concerned. The only parallel is at A 1.3.20, where Socrates and Plato are parenthetically said to have the same views on every subject. Diels ascribed it to AD, as is clearly the case for the two preceding lemmata in S, presumably on stylistic grounds. But the doxa with its reference to a Presocratic philosopher is more easily located in the *Placita* than in an account of Hellenistic philosophy. Moreover, the Apollodorus in question, as author of the Περὶ θεῶν, is the Athenian (*DPhA* A244, born c. 180 BCE) and not the Stoic person of that name (of Seleucia, *DPhA* A250). The style remains difficult to rhyme with A's usual practice, though the absence of a *verbum dicendi* speaks in favour of A. The adjective Πυθαγορείαν referring to Pythagoras (not his followers) is not used elsewhere in this manner in A. The same doxa is found in the previous chapter attributed to Parmenides as πρῶτος εὐρετής (A 2.15.7), but the ascription to Pythagoras is given at D.L. 8.14. There is no other reference to Apollodorus in the *Placita*. All in all, the provenance must be considered uncertain, but it would be rash to leave it out of our edition.

e Other Evidence

On the material in Ach, which is of little value for the understanding of the present chapter see above section B.

Commentary

A *Witnesses*

(1) P has four lemmata only, preserved in E and the Byzantine mss. and translated by Q. Only the first is retained in G. The first doxa addresses the question posed in the chapter’s heading. The remaining three patently focus on another question, the source of the heavenly bodies’ nourishment if they are to be regarded as living beings (which is not explicitly stated). There is an obvious strong link between illumination and sustenance, but this is not made explicit in the doxai.

(2) Six lemmata are preserved by S, of which the first four correspond to those in P, but in a different sequence. But in order to get his grand scheme of coalescence in ch. 1.24 to work he has made various changes when com-

pared with P. In 1.24.11 the doxa is placed under 2.13.8 which has the name-labels Parmenides–Heraclitus. From P it is clear that the original names were Heraclitus and the Stoics, which makes much better sense. The second lemma supports the reading of the single name-label Plato in E, and not the composite Plato–the Stoics in P^B. The final cluster of three doxai in 1.24.3 is important because it adds two doxai to P's first doxa which he must have epitomized away. But these additional doxai give rise to various textual problems to be considered below.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Since it was almost universally held that the stars produce their own light (see the main diaeresis in 2.13, where both alternatives assume that light is emitted), the specific topic of this chapter as indicated in its heading is seldom encountered. Symeon Seth tells us that there is much controversy on the subject, and indicates that the main division of opinion centres on whether the heavenly bodies are all illuminated by the sun or have their own light; text cited below under section E(a) General texts. The further details he gives show that he is probably thinking only of the planets, though the phrase *περὶ πάντων τῶν ἀστέρων* could refer to the stars as well. The question of the stars' nourishment is also infrequently addressed. Ach's chapter 13 asks the question *εἰ ζῶα οἱ ἀστέρες* and Philo in his list of doxographical questions on the stars asks whether they are ensouled (*Somn.* 1.22), but neither text reflects what their source of nourishment would be if they are living creatures.

(2) *Sources.* Aristotle does not include the question of the source of the stars' illumination in his outline of topics when beginning and ending his treatment of the heavenly bodies (*Cael.* 2.7 289a11, 2.12 293a12). But he briefly touches on the topic early in his discussion at 2.7 289a20–21, developing his strange theory that it is caused by friction with the underlying air (text below section E(b) General texts). The topic of the stars' nourishment also does not arise in Aristotle's *De caelo*, because his doctrine of the impassibility of the fifth element does not allow such a view (it is also not raised in Plato's *Timaeus*, where the heavenly bodies consist mainly of fire). He does briefly refer at *Mete.* 2.2 355a18–20 to the view that the stars are nourished by the exhalations from the ocean as a *reductio ad absurdum* when arguing against the view of the sun being nourished in this way. The Stoics ignored this criticism and developed the view earlier attributed to Heraclitus that the heavenly bodies are nourished by moist exhalations from the earth. See various texts in Cicero, Cleomedes and Plutarch cited below in sections E(a) and (b). They have very limited doxographical elaboration. At Cicero *ND* 3.37 reference is made to Cleanthes (*SVF* 1.501), but in relation to

the sun only (cf. A 2.20.6), while in D.L. 7.144 the same doctrine is attributed to Posidonius in relation to the moon. The philosophers mentioned in a late text in Proclus are obscure and foreign to the doxographical tradition. The question of the source of the stars' illumination is also relevant to the question on the nature of the Milky Way, e.g. the view of Democritus that its appearance is derived from the clustering of stars (A 3.1.8), but this is treated as part of meteorology; see Commentary on ch. 3.1.

C Chapter Heading

The chapter heading is only preserved in the witnesses in the P tradition, where there is no variation. S does not include it in his heading for ch. 1.24, which combines topics from 2.13 to 2.19.

There is no variation in any of the witnesses concerning the heading of this chapter. The verb φωτίζονται in the chapter heading corresponds to the noun in the chapter on the illuminations of the moon, 2.28 Περί φωτισμῶν σελήνης. For headings asking the question πόθεν (from where)—six in number in A, i.e. also chs. 1.6, 2.5, 4.21, 5.11, 5.28—see above ch. 1.6 Commentary C and 2.5 Commentary C. This chapter's heading is strictly parallel to that of ch. 2.5, except that the verb is φωτίζω (illuminate) rather than τρέφω (nourish). It indicates that the question is one of source or origin. As the contents of the chapter reveal, illumination is, or rather can be, the result of nourishment.

D Analysis

a Context

In ch. 2.13 it was already indicated that the heavenly bodies are all in some way or another fiery and so must gleam or shine. The source of their illumination is now explicitly addressed. The second half of the chapter then focuses on a different though related question which is exactly parallel to that treated in 2.5, Πόθεν τρέφεται ὁ κόσμος.

b Number–Order of Lemmata

The six lemmata fall into two distinct groups. Only the first doxa in P and the cluster of three in S address the chapter's theme as indicated in its heading. The remaining three doxai in P and S answer the question on the provenance of the heavenly bodies' nourishment. The basic order as found in P can be preserved. The cluster in S is thus a block and indicates that P has excised the two following doxai. It will emerge when the sequence of doxai is more closely examined that it is most unlikely that the chapter is complete as we now have it.

c Rationale–Structure of Chapter

The first three doxai all record essentially the same doctrine. The view that the luminosity of the stars was due not to their own inherent nature but to the sun, on an analogy with the majority view on the moon's light, is of course rather odd and scarcely attested elsewhere in ancient thought (in Boll's survey, (1909) 2411–2412, this is the only evidence for it). Given the usual method of the *Placita*, it must be strongly suspected that originally there was an opposition between the view that the stars have their own light (the majority view) and the view that they are illuminated by the sun (minority view). This is the diaeresis that controls the structure of the parallel chapter on the moon (2.28). No examples of such a diaeresis have been found in ancient sources. Nevertheless Mansfeld–Runia in their reconstruction (M–R 2.2.502) decided that it was justified to conjecture a first most likely anonymously attributed doxa presenting the majority position that the heavenly bodies have their own light, which both P and S overlooked or which—more likely—fell out early in the tradition. The formula used, οἱ μὲν πλείστοι ἴδιον αὐτοὺς ἔχειν φῶς, was based on similar doxai in 5.12.1 and 2.28.1. In the present edition, however, it is not appropriate to introduce such a massive intervention in the text. The name-labels of these three doxai also give rise to problems which will be further discussed in the detailed comments below.

The remaining three doxai are more straightforward. They are largely parallel to the doxai in the related chapter on the cosmos' nourishment in ch. 2.5, but in the case of the Aristotelian and Platonic doxai are presented in a more compact form. The argument in the Aristotelian doxa is also reversed: A now argues from the everlasting nature of the stars to the conclusion that they do not need nourishment, whereas in the earlier chapter he is recorded (less happily) as arguing the reverse. The Platonic doxa here does not indicate that the source of the food is internal decay. The third position of Heraclitus—the Stoics is also simplified compared to that of Philolaus in A 2.5.3.

Is it likely, therefore, that these two subjects were treated together in the single chapter, or did A originally have two chapters which—perhaps again early on—were joined together? Certainly the parallel in the treatment of the cosmos suggests there were originally two chapters. At M–R 2.2.501 we took the bold step of introducing an extra chapter heading in our reconstruction with the conjectured formulation Πόθεν τρέφονται οἱ ἀστέρες, but once again this would be a step too far for the present edition.

d Further Comments

Individual Points

§1 Metrodorus of Chios, the pupil of Democritus, is cited no less than 6 times in Book 2 and particularly often in the chapters on the heavenly bodies (also 18.2, 20.8, 28.5). The last doxa is exactly parallel to this one, but more plausibly relates to the moon's illumination. The emphatic mention of *all* (ἅπαντας) the heavenly bodies perhaps implies a contrast with the view that only some of them are illumined, e.g. the moon or the Milky Way, which may have been exploited in an earlier fuller tradition.

§2 The text shifts from τοὺς ἀπλανεῖς ἀστέρας for Metrodorus to τὰ ἄστρα for Strato, but as Sharples (2011) 107 notes, in both cases the reference is most likely to be to the stars and not the planets. The only other doxa attributed to Strato the Peripatetic in Book 2 is at 2.11.4, where he is reported to hold that the heaven is πύρινος, a view which—as Wehrli (1969) 64 notes—does not agree very well with the present view, although it is possible that he held that the stars both had their own light and reflected that of the sun. As in the case of the Cleanthes doxa at 2.16.1 it must be suspected that this doxa is mistaken. The phrase καὶ αὐτός used for Strato is rare in the *Placita*. It does not occur linked to a name-label in P and is elsewhere only found at S 1.24.1h, i.e. in this same chapter, where it is plainly added for the doxa of Metrodorus to cover up a difficulty in the grand scheme of coalescence; see above ch. 2.15, Commentary A(2). The same process of splitting up an original doxa with multiple name-labels may have happened here (but note that there is no *need* for S to make the change here).

§3 The same argument can be made for this doxa. It may be an expansion of a name that was part of a list of name-labels such as we saw for example in A 2.16.1. On Diotimus of Tyre see Dorandi *DPhA* 2.886. He was a disciple of Democritus, as indicated in Clem. Alex. *Strom.* 2.130.6 and S.E. *M.* 7.140. The scanty references to him are collected in DK 76. Dorandi accepts the brilliant conjecture that Diels makes here, even though he did not include it in his text of *DG* (but did do so when he published the first edition of the *VS* many years later). The name-label occurs only here in A. He is thus one of the 36 unique name-labels found in A's compendium; see Jeremiah (2018) 302.

§5 This argument is not found in the extant writings of Aristotle, though it follows on from the characteristics of the 'first body' (i.e. fifth element) as outlined in *Cael.* 1.3 270b1, where it is said to possess neither increase nor diminution. Effe (1970) 19 argues speculatively that it was put forward in the dialogue *De philosophia* as witnessed by Philo *Aet.* 21–24 and 74 (Critolaus); see our comments above on ch. 2.5, Commentary D(d)§1.

§6 The doctrine attributed to Plato is clearly based, just like at A 2.5.2, on the text of *Tim.* 33c6–7 (cf. Philo *Aet.* 25–27 who cites this text). Here it is extra-

polated from the cosmos as a whole to the heavenly bodies. In their case the question may be asked why the stars, which primarily consist of fire (*Tim.* 40a2, cf. A 2.13.11), can burn everlastingly without consuming their fuel. On the Stoic view that this cannot be the case see the argument at Cicero *ND* 2.118 (*SVF* 1.593, text cited below section E(b)§4). On the sun's sustenance from the sea see further on A 2.20.6.

e Other Evidence

On the evidence in Ach and Philo on whether stars are ensouled see above section B.

Commentary

A *Witnesses*

(1) In the tradition of P all four witnesses agree that it has two lemmata only. The main point of textual interest is the variation among the witnesses between longer and shorter titles.

(2) S writes out only one of the two doxai in P, attaching the view of Xenophanes to an earlier doxa in 2.13. The words οὗς καὶ Διοσκούρους καλοῦσί τινες have clearly been added in order to compensate for the fact that the heading of the chapter which refers to the Dioscuri was not included in the composite chapter heading of *Ecl.* 1.24. The omission of the Metrodoran doxa is puzzling because it goes against S's usual practice and the lemma could have easily been added to other doxai of the same philosopher cited at 1.24.1h or 1.24.3. It may have been the result of oversight or S may have felt that the psychological explanation given fitted in less well with his collection of physical doxai.

B *Proximate Tradition and Sources*

(a) *Proximate tradition.* There are no doxographical parallels for this chapter apart from the tradition of A, including 'cousin writings' such as Ach.

(b) *Sources.* The meteorological phenomenon is not discussed by Aristotle in his *Meteorology*. But a remark on the cause of lightning at *Mete.* 2.9 370a12–22 shows some similarities, namely the view attributed to Cleidemus (fr. 62.1 DK) that lightning does not have an objective existence but is no more than an appearance and can be compared to the sea being struck (e.g. by an oar) at night, causing the water to flash (ἀποστίλβον 370a14). On the key role of the concept of reflection (τὰ κατ' ἔμφασιν) in Aristotle and its influence on the *Placita* see below section D(c).

Other parallel texts are also scarce. The allegorical explanation of the Dioscuri in terms of the two hemispheres above and below the earth, which is found in Philo, Sextus and Lydus, is foreign to the method of the *Placita*. Seneca argues that it is a meteorological and not a theological phenomenon, and that if it gives hope (the Dioscuri were known as 'saviours', cf. Strabo 5.3.5), this occurs because it indicates that the storm is losing its force. Sextus also cites it in an argument as evidence for the existence of divinities in the air. Lydus records an arithmological doctrine attributed—no doubt spuriously—to Epimenides (one of the seven sages) and his followers. The chapter is an example of the kind of esoteric material that A likes to include.

C Chapter Heading

The heading is of the usual *Περὶ* x type, moving from general questions on the heavenly bodies to a particular constellation. The tradition of P records four different headings. Given that all the other headings in chs. 2.13–19 contain either the term ἀστέρες or in one case (ch. 2.13) ἄστρα, it is prudent to retain the reference to the heavenly bodies. There is little to choose between the different readings of P^B. Mau and Lachenaud against Diels opt for the longer heading in P^B, Q and Ps, and we follow their lead. But should we read ἄστρων or ἀστέρων? We retain the former in the oldest ms. (and supported by the majority of the mss. of Ps), but the fact that the first lemma reads τοὺς ἀστέρας and its predominance in the headings of chs. 2.14–17 might induce one to choose the latter (it is found in the other mss. of P^B and a minority of the mss. of Ps).

D Analysis

a Context

So far in the section of Book 2 on the stars, all the chapters have treated themes for which there are analogous chapters elsewhere, e.g. on the cosmos or on the earth. This chapter and the next treat themes that are peculiar to the stars. One can compare the section on the moon (2.25–29) and the earth (3.9–17), which also end with chapters that discuss themes peculiar to these two bodies.

The chapter deals with the phenomenon of St. Elmo's fire. It could have easily found a place in Book 3 on meteorology. It may have been placed here perhaps because the mythical figures of the Dioscuri are also associated with the constellation of the Gemini (a late development, see below section D(e)). Since the phenomenon generally occurs at sea and was often taken as a portent, it is neatly placed between 2.17 (stars fed by the ocean) and 2.19 (stars as signs).

b Number–Order of Lemmata

There is every reason to think that the chapter in A originally only had the two lemmata preserved in P, particularly when we take the diaeretic structure into account.

c Rationale–Structure of Chapter

With its two doxai the chapter records the minimum brevity of presentation in the *Placita*, a single diaeresis with two opposed points of view (cf. chs. 2.8 and 2.10; 2.12 is an exception). The doxa of Xenophanes gives a physical explanation of the phenomenon in terms of his fiery cloud(let) theory, which occurs four times in Book 2 (also at A 2.13.13, 20.2, 25.3). The view of Metrodorus, in

contrast, presents a psychological or epistemological explanation, i.e. from the viewpoint of the observer. As noted above, this different kind of explanation may have been the reason why S omitted it.

It is also possible to relate the diaeresis to the antithesis between reality (κατ' ὑπόστασιν) and appearance (κατ' ἔμφασιν) that is dominant in the meteorological chapters 3.1–6 and derives fairly directly from Aristotle's *Meteorologica*. See further Introduction to Book 3, section 2, ch. 3.5 Commentary D(d) General points, and also Mansfeld (2005a). From this viewpoint the attribution of the doxa to Metrodorus is surprising because in his many other doxai recorded in Book 3 (A 3.1.3, 3.2.10, 3.3.3, 3.4.3, 3.5.12, 3.7.3, 3.9.5, 3.15.6, 3.16.5) there is no evidence at all of non-substantial views. But, as Lachenaud notes ad loc., he is mentioned in A 4.9.1 as part of a long list of name-labels associated with the view that the senses are false.

d Further Comments

Individual Points

§1 As Mourelatos (2008) 134 points out, Xenophanes was almost certainly the first to offer a naturalistic explanation of this unusual meteorological phenomenon. He notes the parallel with fr. B32 DK ἦν τ' Ἴριν καλέουσι, νέφος καὶ τοῦτο πέφυκε, / πορφύρεον καὶ φοινίκεον καὶ χλωρὸν ἰδέσθαι, but recognises that the phrase οὗς καὶ Διοσκούρους καλοῦσιν τινες may be an addition of the doxographer (or S, as we think).

Diels *DG* 220 n. 2 was struck by the facts that the term νεφέλια is used to describe Xenophanes' doctrine, which could not have occurred in his poem because it cannot fit the metre, and that this term for a cloudlet occurs on a number of occasions in Theophrastus (fr. 6.11, 20, 23, 43 Wimmer) and also at Aristotle *Mete.* 2.8 367b10. (He might have added that the fairly rare word στίλβηδών also occurs in Theophrastus at *Hist.plant.* 5.4.2.) The language betrays its source, he states. Such arguments are ingenious but attempt to prove more than is possible from the nature of the evidence.

e Other Evidence

No trace of this subject is found in Ach or the Aratea. As scholars have noted—see Bethe (1905) 1097, Kraus (1957) 1128–1129; Mourelatos (2008) 160 n. 16—the connection of the Dioscuri both with St. Elmo's fire and with the constellation of the Gemini are late developments. No mention of the two brothers is made in the poems of Aratus and Manilius, but there is a reference to constellation in ps.Eratosthenes *Cat.* 10, to be dated to about the time of A. It should be noted that the connection with the Dioscuri in our chapter only occurs in the chapter heading, and not in its doxai. Allusions to St. Elmo's fire and the assistance given

by the Dioscuri to sailors at sea are found a century later in Lucian *Navig.* 9, *Charidemus* 3.

Commentary

A *Witnesses*

(1) Three lemmata are preserved in the Byzantine mss. and in Q. G only has the title (in a shortened form) and an abridged version of the first doxa. E does not copy out this chapter, which hampers the determination of the text.

(2) 2.19 is the final chapter that S absorbs into his grand scheme of coalescence in *Ecl.* 1.24. He writes out all three lemmata also found in P, making significant adaptations of the text in the first two. He also includes a reference to the chapter heading in his combined title for 1.24, Περί οὐσίας ἄστρον καὶ σχημάτων, κινήσεώς τε καὶ ἐπισημασίας.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* There is no clear evidence of doxographical treatment of this theme in the proximate tradition comparable to what we find in this chapter. However, It is possible that Philo's reference to the heavenly bodies' συμπάθεια πρὸς τε ἀλλήλους καὶ ἐπίγεια at *Somn.* 1.53 is an allusion to the subject of our chapter. This text belongs to a cluster of Philonic texts dependent on

an earlier phase of the doxographical tradition; see further ch. 2.11 Commentary B, 2.13 Commentary B. We note also a scholion to the same lines from Aratus quoted by A, which gives a view on the subject that is formulated in a manner quite similar to that found in A (text below under section E(a)§3). The example of the Pleiades is the same as is found in the text in Pliny to be discussed below.

(2) *Sources*. The general theme of the interaction between the movements of the heavenly bodies and the turning of the seasons goes back to Hesiod (*Op.* 414–419). The more specific theme of the signs of the seasons indicated by the heavenly bodies and in particular their risings and settings is perhaps alluded to by Plato in the *Timaeus* (hence the doxa in this chapter), but is absent in Aristotle. Theophrastus certainly wrote a book *Περὶ σημείων*. We know this from Diogenes' lists and from a report in Proclus, who tells us that he discussed the Chaldeans in this work and made reference to their astrological doctrines (texts below under section E(b) General texts). See further Cronin (1992) 310, Sharples (1998b) 162. The surviving treatise under his name with that title is spurious (though Cronin 1992, 336 concludes that Theophrastus' treatise may have been one of its sources). It prominently cites the theme in its opening section. Epicurus in his letter to Pythocles discusses the subject of weather signs and in fact uses the same term *ἐπισημασία* that we find in A, but in his listing of causes he makes no reference to the heavenly bodies. Later texts in Geminus, Vitruvius and Ptolemy make reference to astronomers or philosophers who have concerned themselves with seasonal signs, including Eudoxus and Aratus (and also Aristotle); see the texts cited below under section E(b) General texts and §3. The last-mentioned text belongs to the tradition of 'Star calendars' (*παραπήγματα*), to which Pliny refers at *NH* 18.213, giving as an instance of disagreement the different views on the morning setting of the Pleiades by Hesiod, Thales, Anaximander, Euctemon and Eudoxus. But this tradition differs from what we encounter in A.

C Chapter Heading

The heading in its fullest form combines the common *Περὶ x* formula with a question enquiring after the cause introduced as often by *πῶς*. All of the transmitted chapter headings, however, are problematic (the early evidence of E is sorely missed). P^B supported by Ps has a double title. The first part covers the contents of the chapter well. The second part adds a subject that is not covered by the doxai themselves, which discuss not how winter and summer occur but what signs of their occurrence are given by the risings and settings of the heavenly bodies. It may, however, have been inspired by the first Platonic doxa which speaks of signs relating to winter and summer (note the same order of winter followed by summer in both heading and doxa). G's heading is

greatly shortened. Since every other chapter heading in the section 2.13–19 has a reference to the heavenly bodies, it is not likely that it will be missing here. The heading preserved by Q appears to be based on the contents of the chapter rather than on the original Greek text (though the reference to the seasons may allude to the second half of the heading in P). The different heading in Sy is based on the second half in P^B. A decision needs to be made between the shorter and longer versions of the heading. Given the evidence of G and the likelihood that the second part is a (superfluous) deduction from the first doxa, it is preferable to choose the shorter version, though of course including a reference to the heavenly bodies. This choice has the advantage of retaining consistency with the other chapter headings in 2.13–18. A similar dilemma occurs in the very next chapter 2.20 on the sun. The shorter version is also supported by S in his conflated heading of 2.13–19, but of course we need to take into account that he may have abridged a longer title present in his text of A.

D *Analysis*

a Context

The final chapter on the heavenly bodies, just like the previous one, introduces a meteorological aspect, examining their role as purveyors of signs in relation to the seasons. It forms a good transition to the two groups of chapters on the sun and the moon, both of which have a more direct influence on the earth.

b Number–Order of Lemmata

It is very likely that our two main witnesses preserve all the doxai in this chapter. S reverses the sequence of the first two doxai, but this can be explained through the process of coalescence. There is thus no reason to suggest that the order differed from what is preserved in P.

c Rationale–Structure of Chapter

The subject of the chapter is indicated by the relatively uncommon term ἐπισημασία in the chapter heading, which is repeated in the first and third doxa (in the second it has been added by S). The context makes clear that it refers to ‘indications of the (changes of the) seasons’. The theme itself goes back to Hesiod (cf. *Op.* 414–419, 546–548), but the poet scarcely makes an appearance in the *Placita* (he only occurs in 1.6, a chapter that to some extent differs from the usual method of the work). The first two doxai reveal a simple diaeresis: Plato regards the signs of seasonal change as occurring through the rising and setting of all the heavenly bodies, whereas Anaximenes attributes these signs to the sun only. The Platonic view is derived from *Tim.* 40c8–d2, where Plato says

that the movements of the heavenly bodies produce ‘fears and signs of events that will happen after these things to those who are unable to calculate’ (φόβους καὶ σημεῖα τῶν μετὰ ταῦτα γενησομένων τοῖς οὐ δυναμένοις λογίζεσθαι). At some stage in the textual transmission of this sentence after Cicero the word οὐ fell away and so the pronouncement lost its negative force, as can be seen in the comments on the text by Proclus cited section E(b)§1 (on this text see further Taylor 1928, 244). The doxa is based on the occurrence of the term σημεῖα, but there is no specific reference to the seasons in the passage. The third lemma does not add a new view but amounts to an illustration of the Platonic view by means of a poetic quote. A similar technique is used in the case of Empedocles in A 1.30.1 and for the anonymous doxa in A 5.19.2. Both Eudoxus and Aratus wrote works with the title Φαινόμενα. Aratus is named only here, though his verses are also cited in ch. 1.6[20–24]. Eudoxus is credited with a view on the sources of the Nile at ch. 4.1.7. On the occurrence of poetic quotes in the *Placita* see M–R 2.1.207.

d Further Comments *Individual Points*

§1 We have not followed Diels in bracketing the words, ἡλίου τε καὶ σελήνης καὶ τῶν ἄλλων πλανητῶν καὶ ἀπλανῶν though they are missing in S and G (but not in Q). Though it is possible that they are a gloss, it is more likely that they were omitted from a fuller original than that they were added. The retention of the phrase heightens the antithesis with the next doxa. The adjectives χειμερινάς and θερινάς qualifying the noun ἐπισημασίας are unclear in their precise meaning: they could refer to signs relating to winter and summer or signs taking place during those seasons. The theme of the chapter makes the former meaning more likely.

§2 The formulation is characteristically loose. τούτων must refer to σημεῖα, though the term has not been used so far in the chapter. ταῦτα (neuter) must refer to ἀστέρων (masculine), unless we read ἄστρον with S, and of course it does not include the sun.

§3 Poetic quotations are rare in A, except in the opening chapters of Book 1 (there are eleven poetic quotes in chs. 1.1–7). This is the only example in Book 2. The text introducing the quote in S, which refers specifically to its author and location, is much clearer than in P, where it has to be deduced that Aratus is the author. The words λέγει οὖν, however, are a tell-tale sign of S’s intervention in the text; cf. M–R 1.233. For examples of poetic quotes introduced by the verb φησί see A 1.3.20, 1.6.1, 4.12.1 (in the last passage the subject is the character in the play, not the author). At A 1.25.4 a prose quote from Leucippus is introduced as λέγει γὰρ ἐν τῷ Περὶ νοῦ. In the absence of further evidence the formulation in P should be retained.

It is of interest to compare the quoted lines in A with the textual transmission of the Aratean text; see the edition of Kidd (1997) ad loc. There is some variation in the readings in the mss. of the witnesses (see the apparatus above). The temptation must be resisted to accommodate readings to the text transmitted in the Aratean tradition. Nevertheless in all cases the best reading is the same as found in the Aratean tradition. The only case where one might hesitate is in the first line, where P reads τάδε. Here S reads τά γε, which is the reading in the Aratean tradition. It is always possible that S might have introduced a correction, but in this case it is justified to print his text. The lines themselves were well-known and are cited twice by Ach in different contexts at ch. 1.7, p. 7.8–10 and in ch. 15 (first line only).

e Other Evidence

A very late text in the Arabic work *Turba philosophorum* (c. 900), later translated into Latin (no later than 13th cent.), preserves information on Anaximenes which shows how his ἀήρ doctrine could be adapted to explain the advent of the seasons. It is thus consistent with the doxa in A, but there is no contrast with other views. On this text see Rudolph (1990), Lacaze (2018) 52–57, 353–354, who argue that the doxographical source is to be identified with Hippolytus (cf. *Ref.* 1.7.3). It should be noted, however, that in that doxographical account there is no reference to the seasons.

Commentary

A Witnesses

The chapter is well-attested in all three witnesses.

(1) In the P tradition the three witnesses P^{BEQ} preserve nine lemmata, of which G retains six, with an extra lemma at the end (Heraclitus) not found in

the other witnesses. The various strands of the tradition show considerable textual variation.

(2) S continues to use a very different method, coalescing A's five chapters relating to the sun in a single massive exercise in coalescence (= 1.25), with a title that combines material from all five titles (Περὶ οὐσίας ἡλίου καὶ μεγέθους σχήματός τε καὶ τροπῶν καὶ ἐκλείψεως καὶ σημείων καὶ κινήσεως; the final two nouns do not correspond to anything in P). S clearly found this a challenging exercise and seven doxai present in the five chapters in P are not included (see M–R 1.233–236). 16 lemmata can be identified as derived from the present chapter. Of those in P all but P₄ (Plato) and P₆ (Aristotle) are found in S. The latter is replaced by AD. S no doubt intended to replace the former with either a quote from Plato himself (e.g. *Tim.* 40a) or another source, but he did not carry out his intention.

(3) T starts somewhat confusingly by citing Xenophanes on the sun *and* the moon, but then gives six further lemmata on the substance of the sun only (he returns to the moon at 4.23), before indicating in a concluding statement that there are others which he passes over. The ones selected are mainly the shorter views, with the Philolaic doxa considerably compressed. T includes the doxai of Plato and Aristotle which S left out. His other five doxai are all found in S.

(4) On the close parallels in Achilles and the Aratea see below sections B and D(e).

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Important parallels to the material in this chapter are located in the collections of doxai relating to individual Presocratic philosophers in Diogenes Laertius, Hippolytus and ps.Plutarch *Stromateis*. See below section E(a) on Xenophanes, Anaximenes, Anaxagoras and Empedocles. The doxai on Xenophanes in the other ps.Plutarch are particularly interesting because he records parallels to both the doxai found in this chapter (§§2, 5, cf. Ach). Our chapter indicates that the source for the latter view (also found in Hippolytus) was Theophrastus. It is clear that there is a shared background for these texts and the *Placita*. Diels' conclusion at *DG* 217, however, that the reference to Theophrastus (augmented by another at 2.29.8) proves that the Peripatetic was the ultimate source for all the parallels in these texts and for most of the material on the Presocratics in the *Placita*, is unjustified. On this question see M–R 2.21–22, 133, 220–224. A safer conclusion is to say that the material of this chapter will for the most part have been drawn from a plurality of earlier doxographical traditions.

It is not so clear how the doxa attributed to Epicurus relates to these traditions. In Lucretius three alternatives are given to explain how such a small

object can emit so much heat. One of these is found in Diogenes of Oenoanda (texts below under section E(b)§14). For the single view in A (also found in Ach) there is no parallel in Epicurus' writings. It most resembles the view of Diogenes of Apollonia.

Even closer parallels to our chapter are found in Ach and the *Aratea*. These are more fully discussed below in section D(e). These texts have incorporated material from sources very close to those drawn on by A.

(2) *Sources*. Quotes preserved from the poems of Parmenides (B11) and Empedocles (B38, B44) are direct evidence—if such be required—that there was extensive discussion of the nature of the sun and how it produces its heat in Presocratic authors, starting already with Anaximander and his famous theory of the sun as a hoop or cartwheel of fire. The second cent. CE sophist Favorinus reports that Democritus discussed Anaxagoras' views on the sun (and the moon) and disputed their originality (see below section B(b)§8).

There is no separate treatment of the nature of sun in either Plato's *Timaeus* or Aristotle's *De caelo*. They both prefer to discuss it in conjunction with the other heavenly bodies. Plato refers to the view of Anaxagoras in his version of Socrates' *Apology* (26d), as does Xenophon in the *Memorabilia* (4.7.7). It is noteworthy that theological aspects of views on the sun, which are prominent elsewhere—whether *pro* (e.g. Stoics in Cicero *ND*) or *contra* (e.g. Anaxagoras in Philo, Lucian, Origen etc.)—are wholly missing in A's chapter and scarcely mentioned in the chapter on God, 1.7 (only a single reference in the lemma on Plato, 1.7.22). Aristotle in his *Meteorology* ridicules the earlier view (Heraclitus) that the sun feeds on earthly moisture, but this did not deter the Stoics from taking it over (text below section E(b)§6).

C Chapter Heading

As we have already seen in the parallel chs. 2.11 and 2.13 on the substance of the heaven and the stars respectively, the witnesses reveal considerable variation in their headings. The heading *Περὶ οὐσίας ἡλίου* of the usual umbrella type is witnessed by P^Q and the Planudean tradition of P^B, and is also presumed by S. It is almost certainly correct. The shorter title in P^{EG} fails to mention the key term *οὐσία* that is found in all the headings in parallel chapters (2.11, 2.13, 2.25, 3.9). Two key manuscripts of P^B have the addition *καὶ ὅτι (καὶ) δύο καὶ τρεῖς εἰσὶν*, which is clearly based on the doxai of Empedocles and Philolaus and also has found its way into the index at the beginning of the Book. Most likely it will have been added at some stage in the long tradition, although as a parallel can be adduced 3.9 *Περὶ γῆς καὶ τίς ἡ ταύτης οὐσία καὶ πόσαι*. It thus adds a question in the category of quantity, but this is only a minor theme in the chapter.

Psellus converts this statement into a question (εἰ πολλοὶ εἰσὶν ἥλιοι) and in the body of his brief chapter discusses it. But the second and third sun that he postulates relate to a Platonist theory of divine creation and not the multiple suns attributed to Philolaus and Empedocles in P.

As we have already seen, for his ch. 1.25 on the sun S puts together a very long heading, combining the titles of 2.20–24 as well as adding two more topics (signs and movement) not treated as such by A. The role of the sun in providing signs is mentioned in A 2.19, but S places the excerpts from that chapter in his 1.24, not here.

D *Analysis*

a Context

This chapter and the next four (20–24) treat the most prominent of the heavenly bodies, the sun. The sequence of topics are, as so often in the *Placita*, reminiscent of the Aristotelian categories. The first chapter thus treats the οὐσία (substance) of sun, taken in a material sense. As is the case in the parallel chapters on the heavenly bodies (§13) and the moon (§25), this first of the five chapters is longer than the others and is one of the longest chapters in the *Placita*.

In Book 1.proœm. 3 the quaestio εἰ ζῶον ἢ μὴ ζῶον ὁ ἥλιος is given as an example of a theoretical, as opposed to a practical, topic. This subject is not touched on in chs. 2.20–24 (and the sun is also not specifically mentioned in Ach §13). On the possibility that there may have been a lost chapter on the subject of whether the heavenly bodies are alive or not see the Commentary Book 1.proœm. A(3).

b Number–Order of Lemmata

The chapter is well-attested, with the three chief witnesses supplying nine, sixteen and seven lemmata respectively. There is thus every likelihood that it has been fully preserved. Yet not a single witness records every single lemma. The challenge is thus to reconstruct the exact number and the original order of the lemmata. Although the basic order is very similar in all three witnesses, there are various discrepancies which can only be explained if we take into account the different methods which they used. This Diels failed to do adequately, so that his reconstruction is quite unconvincing (on this see further M–R 2.520). The chapter can be reconstructed in nine steps, which will now be presented in outline (for a fuller analysis see *ibid.* 520–524).

(1) Starting towards the end, we note that the sequence Philolaus–Empedocles–Epicurus is the same in P and S (P7–9, S11–13), that Philolaus occurs as last doxa in T (T7) and that Ach testifies to the sequence Philolaus–Epicurus.

(2) The following doxa in S (S14) on Parmenides is surprising because it speaks about the sun *and the moon* originating in the Milky Way. A parallel is found in ch. 28, where another doxa on the sun *and the moon* is certainly placed last in the chapter. A often places doxai that fit in less well or add additional material at the end of his chapters, and that is likely to have happened here.

(3) A next significant correspondence between our witnesses occurs in the case of the sequence Anaxagoras–Thales–Diogenes in S8–10 and the sequence Anaxagoras + Democritus + Metrodorus–Thales–Diogenes in T2–4. That the triple name-label in T2 was already present in A is confirmed by P5. S repeats the doxa with Democritus's name-label in S15 and coalesces with a doxa from ch. 2.23, but then omits the name-label of Metrodorus. It is misguided to conclude that T made direct use of P rather than A in this instance, as argued by Bottler (2014) 512 (he could have done so via E, but if he consulted E he did so only for A 1.7.1; see Mansfeld 2016e = M–R 4.176–184). S often splits up conjoined names in the process of coalescence: there are two other examples in this same chapter in the way he treats the multiple name-labels in §§3 and 6. On the mistake that S most likely made in relation to Metrodorus see (7) below.

(4) In both P and T a doxa attributed to Aristotle follows the group just discussed. It is missing in S because it has been replaced by a long extract from AD (1.25.4 = fr. 10 Diels, cited below section E(a)§11). We note that AD's formulation at the beginning of the account is equivalent to that of A, but differs in terminology (οὐσία instead of σώματος).

(5) It is clear from P and T that the chapter contains a Platonic lemma which S dropped, no doubt because he was going to replace it with an extract from the *Timaeus*. But this in fact does not take place (he may have later discovered that Plato does not speak explicitly of the nature of the sun). It is best to place it in the order found in P (P4). T will have first left it out and then decided to include it after the Aristotelian view (T6), perhaps because it moves from a single elemental substance to a combination. The formulation of the doxa itself is slightly more elaborate in T than in P. T may have added this extra information from his own knowledge, but it is safest to include it in our text.

(6) Preceding the Platonic lemma in P is a doxa attributed to the Stoa (= P3), the sun as 'an intelligent ignited mass from the sea'. Omitted by T, it corresponds to two doxai in S, S7 and S16 (where the doxa apart from the name-label is almost identical). It is easy to reconstruct what has happened. S will have split up a single doxa to suit his separation into clusters of views of individual philosophers. P has recognized the doxa as basically Stoic and so has simplified the three names in S, Heraclitus–Hecataeus–Cleanthes, to the single label 'the Stoics'.

(7) Next there are three lemmata in S which are not found in the other two witnesses, S4–6. It is striking that S4 and S5 have exactly the same content, and it might be suspected that originally they formed a single lemma with again three conjoined name-labels. However, S's inclusion of the name-label Metrodorus and its coupling with Parmenides conflicts with the evidence of P and T, where his view is added to that of Anaxagoras and Democritus. This is almost certainly a mistake on S's part (the coupling of Democritus and his pupil Metrodorus is anyway more likely than the latter with the Eleatic Parmenides).

(8) The most difficult part of the chapter is its beginning. The evidence can be summarized as follows:

P1	Anaximander	S1	Xenophanes (cf. P2b)	T1	Xenophanes
P2	Xenophanes I + II	S2	Theophrastus (cf. P2a)		
		S3	Anaximander		

The first problem concerns the name-labels. Does the second lemma in S introduce the view of Theophrastus, or is the Peripatetic reporting on Xenophanes' doctrine, as is suggested by the joining up of the two views in P? Despite the views of some scholars (see esp. Steinmetz (1964) 334–351), we side with Usener and Diels in attributing both doxai to Xenophanes (see further the lengthy discussion in Runia (1992), and also M–R 2.523). But this does not necessarily mean that they were linked together in A. It is reasonably common in the *Placita* for more than one doxa to be ascribed to a particular philosopher in the same chapter (see for example Diogenes in ch. 2.13 and Xenophanes again in ch. 2.24), the reason being that the doxa is of greater importance for the doxographer than the name-label attached to it. The possibility must be entertained, therefore, that either P or S or both have coalesced these two doxai. In our view S's procedure makes it very likely that they were originally separate. He would not have separated the two doxai on the sun's $\sigma\upsilon\sigma\tau\alpha$ with a doxa on its eclipse if they had not been originally distinct. It should be noted too that both doxai are given quite separately in ps.Plut. *Strom.* 4 (see texts below section E(a)§2, §5). Moreover, given the strong link of the second Xenophanean doxa with the 'Stoic' view of Heraclitus–Hecataeus–Cleanthes, it is plausible that it preceded the latter, as indeed occurs in P (where the other Xenophanean view is appended). It also makes a smooth connection with the preceding view of Antiphon which also involves the moist air.

The second problem is how the chapter starts. Does it commence with the view of Anaximander as in P, or does it start with Xenophanes as in S and T? Both views can be defended. In an early treatment we gave the preference to S (Runia 1992). But since then we have changed our mind (M–R 2.524), because

we recognized that in the long chapters on the οὐραία of the stars, sun and moon (2.13, 20, 25), a privileged position was given to the Milesian philosophers—no doubt connected with the role that the very early philosophers and the successions play in the *Placita* (on this see further M–R 2.73–96). The parallel with the chapter on the moon (2.25) is particularly impressive. Therefore, it is more likely that P has preserved the original beginning of the chapter. Why then did S commence with Xenophanes? A possible explanation is that he was attracted to the pithy expression of Xenophanes' view, in contrast to Anaximander's doxa with its idiosyncratic position that the sun is in fact a circular hoop. He then added the second Xenophanean doxa before writing out the longer doxa of Anaximander.

(9) One final problem remains: the additional lemma in G recording the view of Heraclitus. Diels *DG* 16, noting that it doubles up on the earlier lemma P₃ = §6, regarded it as an attractive addition, but in his own words 'did not dare to add it to P in the absence of S' and does not even mention it in the apparatus to the text of P. Revising our view in M–R 2.524 we now argue that there are good grounds for including it. (a) As noted above on §§2 and 5 there are other cases of name-labels being repeated in a single chapter. A may have wished to repeat it because the additional information was not attributable to the other two name-labels in §6. (b) There are cases where G contains additional information not found elsewhere in the tradition of P; see M–R 1.150 and examples at chs. 5.19 (where confirmed by Q) and 5.23. (c) As Diels noted, the extra information is likely to be authentic; cf. fr. 22B30 DK ἀπτόμενον μέτρα καὶ ἀποσβεννύμενον μέτρα, ch. 3.3.9 (on firewinds) and the scholion on Plato *Resp.* 498a; a similar doctrine for the sun is attributed to Metrodorus of Chios at ps.Plut. *Strom.* 11 = 70A4 DK and for the stars to Xenophanes at A 2.13.14. It is best placed towards the end of the chapter, as indeed suggested by its location in G. Like §16 it records additional information of an unusual nature.

It may be concluded, therefore, that the chapter has sixteen lemmata and that its original order is well reflected in P, except that he has coalesced the two Xenophanean doxai that stood apart in A, and to a lesser extent also by S and T. The sequence of doxai in our reconstruction is plausible and, as we shall now see, is reinforced by the rationale that can be given for the chapter's structure as a whole. It cannot, however, be considered certain in all respects.

c Rationale–Structure of Chapter

The basic structure of the chapter is determined by the antithesis between the view that the sun consists of fire (§§1–3) and the view that it is basically an inflamed earthy rock (§§8–10). The antithesis, which is also dominant in the parallel chapters 2.13 and 2.25, fits in well with the evidence of doxographical-

dialectical parallels. The rhetor Hermogenes (?) gives as an example of a *θέσις* the subject εἰ ὁ ἥλιος πῦρ. No alternative is given, but it is implied that one exists. In the *traditio secunda* there are two texts in the Aratean tradition which give prominence to this antithesis (texts above). In the example of a quaestio on the nature of the sun in Achilles §2 the view of Anaxagoras that it is a clump of rock (μύδρος) is opposed to the Stoic view that it is πῦρ, with the Aristotelian quintessence added as a third view. In the very brief chapter on the sun in the *Isagoge* the view that it is fire is placed first (as in A), with the view of Anaxagoras that it is a μύδρος opposed to it.

In between the two basic positions there are four lemmata (§§4–7) which link the sun's fiery substance to the intermediate elements air (§4), water (§§5–6) or all three (§7). This group clearly has a bridging position. The final five views (§§11–15) form a less homogenous group of additional and exceptional views. It might be thought that the Aristotelian doxa (§11) would have been better placed after the fiery views. A has perhaps seen a (not very pertinent) link with the mention of the αἰθήρ in the previous Diogenes lemma. The next two lemmata, both involving multiple suns, clearly form a contrasted pair. The placement of the next lemma, §14 attributed to Epicurus, seems at first sight a puzzle. Its contents are little different to the view of Diogenes in §10 and seem based on it. In other chapters in Book 2 Epicurus' views are often placed at the end (cf. chs. 2.2, 2.4, 2.13, 2.22, also 3.15) because of his espousal of the theory of multiple explanation, on which see ch. 2.2 Commentary D(c). Apart from the parallel doxa in Ach the only surviving evidence on Epicurus' own view is the general account on the heavenly bodies in D.L. 10.90, in which the alternatives 'pneumatic or fire-like or both' are given. But other texts in the Epicurean tradition suggest that originally more specific alternatives were given on the nature and role of the sun; cf. Lucretius *DRN* 5.597–613; Diogenes of Oenoanda fr. 13 Smith—note that it begins with the key term ἐνδέχεται; see the texts below under section E(b)§14. It is likely, therefore, that at an early point in the tradition—already witnessed by Ach—just one of the explanations offered by Epicurus became fixed as his (single) position, even though that was counter to his general view on our knowledge of the heavenly bodies. The second Heraclitean lemma §15 repeats the substance of the sun from §6 in a condensed form and, as argued above in section D(b)(g), adds material specific to this Presocratic philosopher. The final lemma §16 is unusual in two respects. It involves a comparison between the sun and the moon. The latter planet has so far not been mentioned in the chapter and will not become the focus of attention until ch. 2.25. There is also a cosmogonical reference, which harks back to chs. 6–7 and seldom occurs in chs. 11–32. It is logical that this doxa should be placed at the end of the chapter.

d Further Comments

Individual Points

§1 It is surprising that S has left out the illustrative image ὥσπερ διὰ πρηστήρος αὐλοῦ, whereas he retains it in the parallel doxa on the moon (A 2.25.1). Since the final phrase in P is also not found in S, it may be suspected that a line of text has dropped out. The image in Ach is that of a trumpet, but the mention of a πρηστήρ is retained. We return to this image below. The other image of the chariot wheel recurs in the parallel doxa on the moon at A 2.25.1. There is also a possible reference to the cartwheel movement of the cosmos in a chapter on the cosmos' motion that may have dropped out of P; see the Appendix to the Commentary on ch. 2.2.

The interpretation of the phrase just cited (οἶον πρηστήρος αὐλόν at A 2.25.1) is difficult and the problems it raises are perhaps insoluble. Couprie (2011) 145–151 rightly points out that the meaning of πρηστήρ as a set of bellows as postulated by Diels *DG* 25–26 is not well attested. He argues that Q's Arabic translation 'wie die Blitze erscheinen' points us in the right direction and that the phrase should be translated 'like through a stream of lightning,' πρηστήρ having something like its usual meaning of 'fire-wind' as in ch. 3.3 and in the passage in Ach. According to Couprie αὐλός here means a spurt or a jet; he is followed by Graham (2010) 59 who translates 'jet of fire'. But this meaning too is rare. It seems better to adhere to the basic meaning of a 'tube' or 'pipe', or perhaps in this context a 'vent', with πρηστήρ retaining its usual meaning of 'fire-wind'. A suitable translation, with reference to a modern equivalent, might be 'like a blowtorch', since this instrument also involves a pipe that channels a hot flame. One would expect a parallel with the phrase that the image is supposed to illustrate διὰ στομίῳ τὸ πῦρ, i.e. διὰ αὐλοῦ πρηστήρας, as we find with modification in Ach, so there may be a problem with the text. Wöhrle (2012) 53 translated fairly literally 'Glutwindröhre'; see further his list of translations at n. 6, to which can be added Mansfeld R² 'Lötrohr'.

Couprie's interpretation poses an interesting methodological problem. He suggests (p. 151) that the phrase in A 2.25.1 may be the original one and that 'Aëtius no longer fully understood what Anaximander had meant with οἶον πρηστήρος αὐλόν'. But our task, as we have often stated, is to determine and interpret what A wrote and not what might have stood in the original source.

§2 The formula used to describe the sun's nature, ἐκ νεφῶν πεπυρωμένων, is the same as that in 2.13.14, in contrast to the doxa on the nature of the moon, for which an identification as a νέφος εἶναι πεπυρωμένον πεπιλημένον is given (on the text see below on A 2.25.3). Mourelatos (2008) 149 argues persuasively that the phrase ἐκ + genitive should be read constitutively rather than generatively (his terminology). His philological note at n. 33 is vitiated, however, by a

failure to take the evidence of S into account. His solution, based on Q, that the text read συναθροίζοντων δὲ (ἧ) τὸν ἥλιον ἢ νέφος πεπυρωμένον is not persuasive because it is most likely that P has coalesced two separate doxai. We follow him in translating πεπυρωμένον as ‘incandescent,’ see Mourelatos (2008) 148.

§4 The Greek of this doxa is difficult. Differently from M–R 2.2.531, we now take the subject of the two infinitival clauses in the second part of the lemma to be the sun (as fire) and not the air. This is also the interpretation of Pendrick (2002) 147. The image is perhaps of a fire moving through a forest. The source of Antiphon’s view here may well have been Heraclitus, as argued by Pendrick *ibid.* 295, who points to A 2.29.6 where the name-labels are linked together. Five doxai are attributed to an Antiphon in the *Placita*, who certainly is Antiphon the Sophist: A 1.12.6 (on time); 2.20.4 (sun); 2.28.4 (moon); 2.29.6 (moon); 3.16.3 (sea). The last four on cosmological subjects are taken from Book 2 of *Περὶ ἀληθείας*; see further Pendrick (2002) 34–36.

§5 There has been much debate about the reference ἐν τοῖς Φυσικοῖς. Diels followed his teacher Usener in attributing it to Theophrastus’ *Φυσικῶν δόξαι* (as they called this work) and so placed it as fr. 16 in his collection of fragments with that title at *DG* 492. We firmly believe, however, that this work was called *Φυσικαὶ δόξαι*. On the title see M–R 2.1.160, with further references to the scholarly discussion, and also our discussion above in the General Introduction, section 5.2. Since there is no reason to question the accuracy of the reference, it most likely refers to a cosmological discussion in his *Physics*, as argued by Steinmetz (1964) 336 (but as we saw above, he errs in arguing that Theophrastus is presenting his own doctrine in this fragment).

§6 The theory that the heavenly bodies are nourished by exhalations from the earth, and in particular its oceans, has already been attributed to Heraclitus and the Stoics at 2.17.4 (and in a different version for the entire cosmos to Philolaus at 2.5.3). The proponents of the view are regarded as ‘ridiculous’ by Aristotle at *Mete.* 2.2 353b33–34, but this did not stop the Stoics from turning his arguments on their head and using the theory as a critical component in their doctrine of the cosmic conflagration. For Zeno it is implicit in his argument preserved by Alexander of Lycopolis (not in *SVF*). It is specifically referred to by Cleanthes, as quoted in Cic. *ND* 2.40 and ascribed to the Stoics in general at *ND* 2.118. See the texts below and the discussion at Mansfeld (1978) 147–151, Hahm (1977) 151 (on Cleanthes).

§7 On the formulation of the Platonic doxa see the note on ch. 2.13.11.

§8 Amusingly the word μύδρον (clump) has become a name-label in the Arabic translation.

§12 The doxa on Philolaus is difficult, both with regard to the text and its interpretation. There is a valuable treatment of the doxa in Huffman (1993)

266–270, but he does not address the differences between P and S in any detail and favours the alternative version in Ach for his interpretation.

The lemma in its fullest form is found in P and consists of three parts: (a) a statement of the sun's basic nature, i.e. ὑαλοειδής (glass-like, i.e. crystalline), followed by a description of its workings by means of two present participles; (b) a consecutive clause showing how the two elements of its operation resemble the sun, leading on to a third element that results from the first two; (c) a final brief summary indicating that what we call the sun is actually the third element. In S and Ach only the first two parts are found. In S there is almost no divergence from P in part (a), with only the mention of warmth (ἄλέα) added (the formulation in Ach is quite different). S's formulation of (b) differs markedly from P and is also much clearer, because it immediately mentions the two 'suns'. The formula introducing the third 'sun', however, is less clear (εἰ μὴ τις καὶ τρίτον λέξει) than in P. Ach also has a consecutive clause and states the complex doctrine even more clearly by immediately stating that the sun is 'triple' (τριστόν). The text preserved in G and Q also suggest that the final clause in (b) began with a reference to the number of suns (they both mention three straight away). Neither S nor Ach have the brief final part (c), but its presence in A is confirmed by T.

It may be concluded that all three reports show striking similarities and clearly derive from the same tradition. We adopt S's text because of its greater clarity. We thus now agree with Huffman and DK (against our text in M–R 2.2.530 where we preferred P's version), although they give no reasons for their preference.

§13 Remarkably Q preserves the reading Ὀλυμπον, which has degenerated into ἥλιον in the other witnesses. As Daiber ad loc. notes, this must be the right reading because it corresponds to an authentic fragment (*Pyth. Or.* 400B = 31B44 DK) preserved by Plutarch (note also that ἀνταύγεια in A recalls the verb ἀνταύγει in that fragment). Mansfeld was right in emending the text in his Reclam edition (1983–1986, 2.100), followed by Primavesi in the revised version (2011, 528) and now taken over by Laks–Most (Empedocles D156 = 2016, 5.476).

The theory of the two suns, which is well-attested—in addition to the passage in Plutarch cited above, see also ps.Plutarch *Strom.* 10 (texts below E(a)§13, (b)§13)—has challenged the ingenuity of the interpreters; see, for example, Guthrie (1962–1981) 2.193; Burkert (1972) 343. For a much more critical approach see, for example, Wright (1981) 201–202, who regards it as 'absurd' and dismisses it on the grounds *inter alia* that 'confusions have often crept into the doxography by the time of Aetius and the *Stromateis*'.

We note, finally, that Empedocles is prominent in A's chapter which explains how reflections in mirrors occur; see A 4.14.1 and our Commentary ad loc., and also 3.5.1–6 on the rainbow (no name-label).

e Other Evidence

Ach's chapter 19 Περὶ ἡλίου has a substantial doxography on the substance of the sun. The term οὐσία is not included in the title, but it is placed prominently at the beginning when the author turns to the subject after some preliminary comments on Aratus and previous writers. The seven doxai reveal significant parallels to A. Plato is brought to the forefront in the first lemma. The next doxa on Xenophanes remarkably appears to combine in a very compact form both doxai in A, first parallel to §5, then parallel to §2. The doxa on Anaxagoras leaves out the adjective διάπυρος found in A and most parallels. The next two on Philolaus and Epicurus clearly derive from the same tradition as A, but are formulated quite differently, with only a limited resemblance in terminology. The last two showing similarities to the doxa of Anaximander in A, but again without precise verbal correspondences.

There is also, in the earlier chapter on the difference between natural philosophy (φυσιολογία) and astronomical science (μαθηματική), a reference to the question of the sun's φύσις which refers to a selection of three views. As noted above when discussing the rationale of A's chapter in section D(c), these form a limited diaeresis of key views. A shorter version of the same doxography is found in another very brief introductory manual to the *Aratea*. On this text see further M–R 1.306.

Commentary

A *Witnesses*

(1) The four witnesses to the tradition of P all record four doxai, with the exception of G, who deletes the view of Heraclitus that comes third in the others. A significant variant is found in the final Epicurean doxa. P^B and Q record a longer version consisting of two views joined by ἤ. E and G have shortened versions containing only the second alternative. In addition Q is alone in placing the name-label Epicurus in front of that of Heraclitus in the third doxa.

(2) S includes A's heading in the composite title for his chapter on the sun (1.25). When the coalesced doxai are disentangled, it emerges that he too records four doxai, those of Anaximander, Heraclitus, Empedocles (not in P) and Epicurus (in the shorter version). For the second of these doxai, the doxa on size is subsumed under the double name-label Heraclitus and Hecataeus, which is obviously taken over from A 2.20.6. Interestingly the doxa on size is placed last in the cluster, after doxai from ch. 22 and 24. Similarly in his collection of Empedoclean doxai too S does not preserve A's order (chs. 20, 23, 21 and 24). The doxa of Anaxagoras is omitted at S 1.25.3a, no doubt because of an oversight.

(3) Unusually (but cf. ch. 2.4) T utilizes this chapter twice. In both cases he explicitly mentions that its subject is the cause of much contention (1.97 λογομαχία, διαφωνία, 4.22 διαμαχή). In the former three doxai are cited, with the name-label of Anaximander in the first doxa expanded with that of Anaximenes. In the latter there are four doxai, with the Empedoclean doxa added to those in 1.97 (but the additional name-label Anaximenes is dropped). In both texts the doxai are considerably altered and in some cases compressed compared with P and S. It is noteworthy that T leaves the Epicurean doxa out of consideration in both texts.

(4) On the close parallels in Achilles and the Aratea see below section B and D(e).

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Many texts show that from the Hellenistic period onwards the subject of the sun's size was a standard example of a θέσις or a *quaestio infinita* that could be discussed by rhetors and philosophers alike (Hermagoras in Cicero, Quintilian). Later, Galen, Alexander and Philoponus use it as an example in discussions of logical questions. An important text at Philo *Somn.* 1.53—no doubt from the same source as the texts discussed on chs. 2.11 and 2.13—shows that by the first cent. BCE the question had also become part of the doxographical tradition and was treated in a standard way involving

comparison with the earth. Interesting use of this tradition is made by Achilles and another Aratean text (see *Testes secundi* above). The evidence in these two texts differs from A in that numbers are used (8, 19 and 18 times the earth), and two of these numbers recur in texts in Cicero (*Luc.* 82, 18 times) and Macrobius (8 times); see the texts below section E(a) General texts. This will have been part of the doxographical tradition that A chose not to use (the differing numbers may relate to the inside and outside rings). It brings to mind the distinction put forward by Seneca in *Ep.* 88.27: the philosopher asserts that the sun is large, the astronomer how large it is. The numbers given in these texts may derive from earlier astronomical material, but they differ completely from the calculations found in the texts of the astronomers Aristarchus, Eratosthenes, Archimedes and Ptolemy (see for example the text of Archimedes with four different measurements in terms of a comparison with the diameter of the moon).

The brief chapter is one of the most interesting in A's compendium because there is such a large amount of comparative material. It allows us to see how the doxographical tradition relates to the philosophical tradition (not just physics, but also epistemology and even logic), and also to the scientific and rhetorical traditions. See the fine analysis of philosophical and astronomical aspects in Barnes (1989), but with very little on the doxographical tradition (mainly on p. 31). The epistemological problems raised by the Heraclitean and Epicurean view that its size equated to how it was perceived was a stock topic which occurs frequently in Cicero, but also in many other authors. For this material see Pease (1920–1923) on Cic. *Div.* 2.10–11; Pease (1958) on Cic. *N.D.* 2.92; and the treatment of Barnes (1989) with a focus on the text in *PHerc.* 1013. Heraclitus' doxai on the sun have been extensively studied in the widest possible cultural and philosophical context in Schönbeck (1998), with an idiosyncratic edition of the present chapter and its various witnesses at 349–350.

(2) *Sources.* The limited evidence indicates that the question of the sun's size was discussed by philosophers in the Ionian tradition, beginning with Anaximander and continuing in the writings of Anaxagoras and Democritus. The earliest speculations will have been cosmological, comparison with the earth forming a very approximate standard of measurement. However, already in Heraclitus (fr. 22B3 DK) epistemological considerations may have entered the discussion: the sun is the size of a human foot, *as it appears* (this addition is attested in the words of Heraclitus himself at *Pap. Derveni* col. 4.6–7, see below section E(b)§4). Aristotle refers to the size of the sun as an astronomical question at *Mete.* 1.8 345b1 (note the comparison with the size of the earth), but the question is far removed from his interests in the *De caelo*. He does refer to the epistemological aspect three times in his psychological writings, each time alluding to the Heraclitean text with the signature term ποδιαῖος (texts

below in section E(b)§4). A similar emphasis is found in a text in the *Epinomis* of Philip of Opus. After Aristotle it remains a standard example of the difference between appearance and reality and recurs in the tropes of Aenesidemus as recorded in Diogenes Laertius. The Heraclitean doctrine is continued in Epicurus and it gives rise to a standard debate between Epicureans and Stoics which is treated at great length in Cleomedes.

C Chapter Heading

The chapter heading is of the usual umbrella type (Περὶ x) and denotes a topic in the category of quantity. There are no variations in relation to its formulation. It is clear from S's composite title that he read the same heading in A. T's introductory sentence at 4.22 also contains a reference to the heading.

D Analysis

a Context

As in the case of the stars in chs. 2.13–19, after discussing the sun's nature (οὐσία), A turns to other questions relating to the sun. The first of these is its size. This was discussed for the cosmos as a whole in terms of whether it was limited or unlimited (ch. 2.1) but not in the case of the stars. It will be treated for the moon (ch. 2.26), but it is surprisingly missing for the earth in Book 3 (in the light of the title preserved by S for his ch. 1.33 it is likely that a chapter may have been dropped by P in this case—in S's absence he is our only witness; cf. Diels *DG* 62, M–R 2.1.198, and see further on ch. 3.9). As in his treatment of the cosmos, stars, moon and earth, A is following the sequence of the Aristotelian categories, in this case the category of quantity following that of substance. See further Introduction to Book 2, section 2.

b Number–Order of Lemmata

In total our witnesses yield five lemmata, with no single witness preserving all five. The order of the doxai in P and T is consistent with each other and so should be followed (S's order is distorted because the exigencies of the process of coalescence). This means that the Empedoclean doxa occupied the second place, as shown by T in his second text.

c Rationale–Structure of Chapter

The chapter appears in the first instance to descend from large to small, using the earth as the main criterion for measurement. As often in the chapters on the heavenly bodies, A starts off with a venerable Ionian (cf. also chs. 2.11–13, 18, 20, 22–25, 28–29). Anaximander and Empedocles have the same measurement, but for the former the detail on the size of ring in which the sun is conveyed

is added. For Empedocles the sun in question is ‘the visible sun’ described in 2.20.13 (the term ἀνταύγεια is repeated from there). The views of Anaxagoras and Heraclitus posit a smaller size. Implicit in the Heraclitean doxa is perhaps a move to a size in terms of human perception. In the final Epicurean view the epistemological perspective is made explicit. Epicurus also occupies the final position in 2.2.5, 2.13.15 and 2.22.4, but in all those texts the emphasis is on possible views (ἐνδέχόμενα), unlike in the present doxa (on the addition of the theme of possible views in P see the detailed comment in the next section). We note too that the term φαίνεται in §5 introduces by implication the antithesis between what is (Heraclitus) and what appears (Epicurus).

If the evidence of the secondary and proximate traditions are adduced, it is apparent that comparison with the size of the earth involving a number of positions is a standard approach. In Philo the movement is in the opposite direction, ascending from small to large. What is very surprising is that A has not included the obvious view that the sun is larger than the earth. Philo has two positions expressing this view (larger and much larger). Both T and G appear to sense this omission. T converts the first doxa into this position, adapting Anaximander’s doxa for that purpose and adding—it seems—the name-label of Anaximenes (see further below section D(d)§1). G has altered Anaxagoras’ view to compensate for the absence (it would seem) and so, because he omits the third doxa, his sequence goes from large to larger. Moreover, on the size of the moon A himself refers to this position in 2.26.1. So the oversight or omission remains a puzzle.

The evidence of Ach can be added. He commences with the above-mentioned view that the sun is larger than the earth, then adds the Heraclitean position, followed by two measurements in terms of numbers (8 times, 19 times). These two measurements are also found in Macrobius (texts cited below). The latter number is also found in a doxography at Cicero *Luc.* 82, which moreover includes the doxai of Heraclitus (without name-label) and Epicurus. The parallel with A is so close that Cicero’s text must be regarded as evidence of a proximate tradition. It seems that measurement of the sun’s relative size by means of numbers was an option in the doxographical tradition that A chose not to utilize here (nor in ch. 2.26 on the size of the moon). Cicero attributes the view that the sun is 19 times the earth to the *mathematici*, i.e. the astronomers, whose views A cites six times in Book 2 (chs. 15.5, 16.2, 16.6, 29.7, 30.8, 31.2). As we have already noted in section B above, Seneca distinguishes between the method of the philosopher and the astronomer. The astronomer’s method of proceeding to which he refers brings to mind Cicero’s reference to Archimedes’ diagrams at *Luc.* 116 (and Aristarchus’ extant treatise Περὶ μεγέθων καὶ ἀποστημάτων ἡλίου καὶ σελήνης). The views that A records are those of the

philosopher, but his method is not to demonstrate that the sun is large. Instead he presents an array of opinions by means of his customary diaeretic method, but it is certainly not done as effectively as might have been expected. Not only is the important view that the sun is greater than the earth not included, but the mixture of comparative views and those involving the epistemological and psychological factors relating to human perception lacks clarity (see the structural diagram at M–R 2.2.543). The treatment is kept very compact, though less so than in the parallel chapter on the moon (2.26) or those on the shape of the two heavenly bodies (2.22, 2.27).

d Further Comments

Individual Points

§1 T in one of his two texts adds the name-label Anaximenes. It is theoretically possible that it was present in T's copy of A, but had been left out by P in his abridgement and S in his process of coalescence. Other possibilities—also remote—are there was a separate doxa attributed to Anaximenes of which he preserved only the name, or that he has anticipated on the use of the name-label in the following chapter 2.22. But, as argued above in section D(c), it is much more likely to reflect adaptation on T's part, since the doxa of Anaximander is too specific to be shared with anyone else, even his pupil. In both texts T states that the sun is 27 times the size of the earth, whereas in the doxai preserved in P and S it is the sun's ring that has that size and the sun itself is the same size as the earth. The adaptation is most likely deliberate, because it allows T to include the alternative view that the sun is larger than the earth which is perplexingly missing in A. For the polemicist T the importance of including this diaeretical option is greater than the accuracy of his report. In his second report he does not bother to mention that the sun of which Empedocles says that it is equal to the earth (in size) is the reflected sun. Here he engages in simplification, not falsification.

§2 In a forthcoming article Couprie (2020) argues that Empedocles' earth was flat and that he may not have realised the consequences: 'If the text on the size of the sun [sc. in Aëtius] is not corrupt, we must assume that Empedocles did not fully understand that on a flat earth the sun cannot be the same size as the earth. Perhaps he did not realize that his various statements—the sun is twice as far from the moon as from the earth, the moon almost touches the earth, the sun is as big as the earth, the heaven is egg-shaped, the heaven has tilted—do not harmonize well together. Or perhaps he did not worry about such details.' As noted in the previous section, the term ἀνταύγεια is repeated from the description of the two suns in A 2.20.13. On the scholarly controversies relating to that text, see our Commentary ad loc.

§3 Couprie (2009) defends the plausibility of Anaxagoras' measurement based on the assumption of a flat earth and the use of a gnomon or a sighting tube. However, the calculation that he reaches, a diameter of either 54 or 78 km is hardly 'many times the size of the Peloponnese' (which is more than 100 km in width).

§4 In other doxographical texts the Heraclitean doxa is usually indicated by the single word ποδιαῖον (sc. μέγεθος) or *pedalis*; cf. T (twice), Ach, Philo *Somn.* 1.53; already in Arist. *de An.* 3.3 428b3, *Insomn.* 1 458b28, 2 468b16, Cic. *Acad.* 2.82, Tert. *Ad nat.* 2.4.15 etc. Against this background it is unnecessary to postulate a possible contamination between P and S on the grounds that T (twice) and Ach agree on the single word formulation, as done by Bottler (2014) 423, 515.

The phrase in A is taken by editors as a citation from Heraclitus' original text; see 22B3 DK (placed in quotation marks), Mouraviev (1999–2003) IIA, T440, Marcovich (2001a) fr. 57, Graham (2010) 163. This intuition was confirmed by the citation using the same words in the *Derveni papyrus*; text below section E(b)§4. However, the papyrus changes the word order to ἀνθρωπίνου εὖρος ποδός, which given its antiquity is likely to be authentic. The two texts demonstrate that the adjective ποδιαῖος which, as noted above, is standard in the doxographical tradition is the result of Aristotelian influence.

It is curious that Q records an extra name-label 'Epicurus and Heraclitus'. Bottler argues that the word πάλιν in the following lemma (§5) as preserved in P only makes sense if it refers back to Epicurus in the previous lemma (§4). But, as Jas has pointed out in an unpublished review of Bottler's study, the word πάλιν, *pace* Daiber, does not occur in Q's Arabic translation. Jas notes that the extra name-label may have already been present in Q's *Vorlage* and suspects that a marginal gloss has entered the text. This is perhaps more likely than that it was added by Q. In any case the name-label must have been added in recognition of the fact that Epicurus defended the same view as Heraclitus (see next comment).

§5 In the tradition Epicurus' views on the size of the sun are frequently associated with the Heraclitean position given in §4, although there is no reference to it in the brief discussion in *Ep.Pyth.* at D.L. 10.91 (including a glossematic cross-reference to *De natura* Book 11); see Cic. *Fin.* 1.20, *Acad.* 2.82, 123, Cleomedes, 2.1.1–25, 339–345, Tert. *Ad nat.* 2.4.15–16 etc. A's formulation is very close to Epicurus' own words in *Ep.Pyth.* 10.91 or another text from which that summary derives (note also Cic. *Fin.* 1.20, abridged version at Cleom. 2.1.1–2; see texts in section E(b)§5). The addition of ὁποῖος to ἡλικος in E is not convincing, since it does not cohere with the chapter's positioning in the category of quantity (G is even more mistaken with οἶος).

In the Byzantine mss. of P and Q two doxai are attributed to Epicurus joined by ἤ. Diels bracketed the former as interpolated from the following

chapter 2.22.4. However, the word *πάλιν* can hardly point forwards. Possibly the phrase was imported from the later text and then *πάλιν* was added with reference to 2.2.5 and 2.13.15.

For a spirited defence of Epicurus' much maligned doctrine see Algra (2001). On Q's brilliant but wayward *Verschlimmbesserung* at Book 1.prooem. 3 see above Commentary D(d) ad loc.

e Other Evidence

Ach has a separate and quite long chapter on the sun's size with exactly the same title as A, but only the first two lines contain doxographical material. The remainder of the chapter discusses the sun's movement (cf. A 2.23). Ach's two chapters thus cover the same ground as A but in a different sequence as follows:

Ach ch. 19 *Περὶ ἡλίου* on the sun's substance, shape and eclipses: cf. A chs. 2.20, 22, 24;

Ach ch. 20 *Περὶ μεγέθους ἡλίου* on the sun's size and movement: cf. A chs. 2.21, 23.

It is clear that Ach has used a doxographical tradition similar to that found in A, but he also includes sizes larger than the earth and uses the two commonly used numbers to indicate them. Of the four doxai only one is found in A, the one on Heraclitus, but without the name-label. The basic method is the same, but in contrast to A there is an ascending sequence of size rather awkwardly interrupted by the Heraclitean doxa. The other text in the Aratean commentary tradition only contains a single number (18×). It is also recalls the doxographical tradition, but does not take the opportunity to present multiple doxai.

Commentary

A Witnesses

(1) The tradition of P is well-attested, with all four main witnesses preserving the same four brief doxai. The unusual doxa of Heraclitus gives rise to textual divergences to be discussed below in section D(d). The majority readings are supported by a scholion to Pl. *Resp.* 498a. The text was cited by Diels *DG* 352 (where his reading σφαιροειδὲς is erroneous, perhaps under the influence of the following doxa); see also Mouraviev *IIA* T442, 1181. On this witness see further on ch. 2.24.

(2) Four lemmata in S record material from this chapter, but they represent only three of P's four doxai. The doxai of Anaximenes and Alcmaeon are separated but identical, and doubtless go back to a double name-label in A (the latter was thus deleted by P). The description ὥς πέταλον in P is not recorded by S. In contrast, the doxa of Heraclitus follows on from the citation of A 2.20.6, where there are two name-labels, Heraclitus and Hecataeus. Clearly the second does not belong in this chapter. The doxa that the sun is spherical is abridged and has the name-label 'the Pythagoreans', as opposed to that of the Stoics in P. S has perhaps deleted the Stoic name-label because he quotes a view on the subject of the sun's shape of Chrysippus from AD later in the chapter (1.25.5b). It may be surmised that A originally had a double name-label οἱ Πυθαγόρειοι καὶ οἱ Στωικοί, though this combination is not found elsewhere in the extant *Placita* (but for a double name-label with οἱ Πυθαγόρειοι see A 2.13.15). It is possible that P has substituted a general label for an individual Stoic, as he did in ch. 2.20, but we have no evidence for this. The final Epicurean doxa is not found in S unlike in his previous chapter 1.24 on the stars, where he did retain a very similar view on the stars' shape. He may have left it out at S 1.25.3f because he felt that its mention of 'all the above-mentioned (shapes)' did not cohere well with the process of coalescence in this case.

(3) T only refers to the subject of the sun's shape in the second of the two passages discussed on ch. 2.21. In a chiasitic construction he inverses the order of the doxai of the two chapters, giving those in ch. 22 before those in ch. 21. Two first two anonymous doxai can be identified as those of the Stoics and Heraclitus in P. T has reversed them, no doubt because the former represents the dominant opinion. The third doxa does not correspond to anything in P or S. It is possible that T records material from A that is not preserved by P or S here. It is much more likely, however, that he has extracted the extra material from A 2.20.1, where the exact phrase in question, ἀρματιαίῳ (v.l. ἀρματείῳ) τροχῷ παραπλήσιον, is used for the sun's circle (also adapted in ch. 2.21).

The comment in this chapter by Bottler (2014) 425 that 'der Weg zu »Aëtios« ist bei dieser Textzeugenlage versperrt' is greatly exaggerated. Ach does not belong to the direct tradition of A. T's additional image can be very reasonably explained, as can the missing name-label in S. To be sure, the finalised text cannot be considered absolutely certain, but is solidly based on an understanding of the practices of the relevant witnesses.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The reference to the doxa of Anaximenes in Hippolytus is evidence that doxai of Presocratic views on the subject of the sun's circular shape were taken up in the earlier doxographical tradition. Two texts in

Stoic doxographies in Diogenes Laertius and AD record mentions of the subject by Chrysippus and Posidonius (or his circle). AD fr. 10 on Aristotle also records an argument that the heavenly bodies cannot be made of fire, since their shape is spherical and that of fire is not. This argument is not based on an extant Aristotelian text. The doxography in Ach is much closer to the *Placita*. See the discussion below in section D(e).

(2) *Sources*. The subject of the sun's circular shape is virtually never discussed outside the doxographical tradition, presumably because it was thought obvious and uncontested. The sun will have been included with the other heavenly bodies in Aristotle *Cael.* 2.8 (note esp. 290a7, which is stated to be the common opinion). Admittedly among the Aristotelian commentators Aspasius give it as an example of a ζήτησις, but more representative surely is Alexander's use of it as an example of an opinion that cannot but be true (see texts below under section E(b) General texts).

C Chapter Heading

The chapter heading is of the usual umbrella type Περὶ x and, just like the parallels at chs. 2.2, 2.26 and 3.10, indicates a question in the category of quality. As in the previous chapter, it is identical in all the witnesses of the tradition of P and is incorporated in S's composite title. It is also alluded to by T in his introductory words at 4.22.

D Analysis

a Context

As he will do later in the case of the moon (chs. 2.26–27), A moves from size to shape, i.e. from the category of quantity to quality. This differs from the sequence of chapters on the cosmos as a whole (chs. 2.1–2), the stars (2.13–14) and the earth (3.9–10) where in each case he moves from nature or substance (οὐσία) to shape.

b Number–Order of Lemmata

It can be considered almost certain that the chapter had four lemmata, as preserved in P. Diels' double-column method obscures the reconstruction and results in two doxai too many. There is also no reason to doubt the order of the lemmata in P, which here is corroborated by Ach.

c Rationale–Structure of Chapter

Formally the chapter consists of a list of three shapes, followed by a fourth 'modal' view which stands in opposition to the others. There is a close resemblance to other chapters on the shape of cosmic bodies—the cosmos (2.2), the

stars (2.14), the moon (2.27) and the earth (3.10)—, though each is subtly different. Here A does not commence with the mainstream view that the sun is spherical, but rather with two Presocratic views. As so often, a venerable Ionian commences the list (cf. M–R 2.95). The Pythagoreans in the third doxa form the transition to the dominant view, further represented by the Stoics (as also in chs. 2.2, 14, 27, and 3.10). Epicurus occupies the same place at the end as in A 2.2.5 and 2.13.15 (where the technical term ἐνδέχῃσθαι is also used; see further on 2.2.5). Epicurus does not refer to the subject in the *Ep.Pyth.* If the sun is as it appears (see 2.21.5), then it can hardly be doubted that it is circular (cf. Lucr. *DRN* 5.564 *rota*). So perhaps Epicurus went on record as saying that the sun could have the various shapes consistent with its being circular, e.g. a (small) flat round disc, a round bowl or a sphere. It is also possible, however, that this doxa is simply an extrapolation on the part of the doxographer or an earlier source.

The paucity of references to this topic indicate that it was not regarded as a serious problem by A's time. However, for our doxographer the views of venerable Presocratics serve to demonstrate that even here a plurality of views exists.

d Further Comments

Individual Points

§2 Although this appears to be the only text that gives us a Heraclitean doxa on the sun's shape, it is consistent with other texts which record the theory that it is like a bowl with fire inside, e.g. at D.L. 9.10. The unusual term σκαφοειδής is derived from σκάφη (to which σκάφος and σκαφίς are related), which has as its root σκάπτω (cf. Beekes 2010, 1342). It signifies something that is dug out, most often a winnow, bowl or trough, but also a ship (we correct M–R 2.2.547 here). It is generally assumed that Heraclitus meant something like a bowl, but Q interprets in terms of the meaning 'ship'.

Oddly G records φακοειδῆ, 'lentil-like'. Aristotle uses the term as a possible shape of the cosmos at *Cael.* 2.4 287a20 and Plutarch uses it for the phenomenal appearance of the moon at *Mor.* 288B. Here, however, it must be wrong. For a plausible explanation of how the mistake occurred, see Jas (2018a) 189. But she rightly hesitates to emend the text.

We note, finally, that the idiosyncratic Heraclitean shape is mentioned by A no less than five times, twice for the sun (also 2.24.4) and three times for the moon (2.27.3, 28.7, 29.3). It is surely authentic, yet recorded nowhere else for the Ephesian philosopher.

e Other Evidence

Ach does not have a separate chapter on this subject, but incorporates a brief doxography consisting of three doxai on the sun's shape in his ch. 19. The second and third correspond exactly to P. The first is anonymous. The adjective *δισκοειδής* is used for the moon's shape in A 2.27.4 (Empedocles) and for that of the earth in A 3.10.4 (Democritus). The doxa here may represent approximately the same view as that of Anaximenes in P and S, as suggested by Maass in his text, since a disk is flat and also would explain why the heavenly bodies float in the air. Ach's brief doxography plainly goes back to a shared anterior tradition of the *Placita*.

Commentary

A *Witnesses*

(1) The chapter is less-well attested than usual in the P tradition. In addition to the Byzantine mss. there is only G, who retains all of the six doxai in P^B except the last. E does not include the chapter and Q records only the title (no doubt caused by haplography). In addition, this chapter is the first for which there is a tiny amount of evidence from a very early copy of P. On the remains of this third cent. codex from Antinoopolis see Barns–Zilliacus (1960–1967) 2.74–81, 3.181–182, M–R 1.126–130. The papyrus snippet contains residual letters from the second to the fifth doxa in P^B, but they are of no significance for determining any textual matters. It demonstrates that the lemmata were written continuously without a break, as was standard practice.

(2) In S the doxai of Anaximenes, Anaxagoras, Diogenes and Empedocles are found joined up with doxai from other chapters on the sun under the corresponding name-label, requiring various small adaptations to the text (in the case of Diogenes S omits to do this, so that the reader would have had no idea of the subject of the doxa). A doxa on the subject attributed to Democritus has no equivalent in P (the words τροπὴν δὲ γίνεσθαι will have been added to the original in A). Because of the process of coalescence S cannot help us with the question of where this doxa was originally placed in A. There is no trace of the doxa attributed to Plato–Pythagoras–Aristotle that is present in P (also deleted by G). It has no doubt been replaced by the long excerpt from AD on Aristotelian doctrine at S 1.25.4.

The greatest difficulty presented by S's evidence is the material on the Stoics. The Stoic doxa in P is found in S under the name-label Cleanthes and follows the lemma taken from A 2.20.6. S commences with περὶ δὲ τῶν τροπῶν φασι,

and the evidence from P strongly suggests that this phrase replaces the name-label οἱ Στωικοί in P. However, S continues with another passage consisting of two lemmata which Diels left out of his reconstruction (only referring to it in the addenda at *DG* 853) and are also not included by Von Arnim in *SVF*. These lemmata are discussed further in the Analysis below at section D(c)(6).

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* References to the subject of the sun's annual motion between the extremes of the two solstices and its causes in the doxographical tradition are scarce. In Hippolytus there is a record of Anaxagoras' view which is parallel to, if a little less explicit, than what is found in A. There is no mention of any early non-standard theories on the sun's movement in Achilles' chapter on the sun, or in ch. 23 on the zodiacal circles and ch. 25 on the five parallel circles of the heavens. Philo at *Mut.* 67 refers to the subject of this chapter when summarising the subjects studied by the investigator of the heavens. This text can be linked to other passages that he wrote at about the same time (*Somn.* 1.21–24, 1.53) which clearly show knowledge of an earlier version of the *Placita* (see further on chs. 2.11, 2.13 and 2.21).

(2) *Sources.* There is ample evidence that the subject of the sun's annual motion between the extremes of the two solstices and its causes was much discussed in Presocratic writings. Thales is credited with being the first to make discoveries on the subject and even to have written a treatise on it (see D.L. 1.23, text below). The τροπαί of the sun and other heavenly bodies were one of the subjects for which Socrates wanted to read the book of Anaxagoras (*Phd.* 98a, cf. Mansfeld 2000a, 12). The material included in this chapter will no doubt go back to these discussions. The reason why so little remains of the discussion is doubtless the dominance of the standard astronomical model once the movements of the sun and other planets had been convincingly explained. Aristotle refers obliquely to some of these discussions in his *Meteorology* when discussing the origins of the sea (see ch. 3.16), but sees no reason to take them seriously (texts below in section E(b) General texts).

We have not yet mentioned, however, some significant evidence in Epicurus. In *Ep.Pyth.* 93 he gives four possible explanations of the τροπαί of the sun, all of which can be located in A's chapter. These are discussed in more detail below in section D(e) below. It is inconceivable that A and the Epicurean account are entirely independent of each other. It is well possible that he made use of discussions in the works of Theophrastus, but there is no conclusive evidence for this hypothesis. See further Mansfeld (1994a) and Runia (2018) 404, 413. It should be noted that when Alexander comments on the Aristotelian

passages mentioned above (*Mete.* 2.1 353b6–9), he states that the view mentioned there is attributed by Theophrastus to Anaximander and Diogenes. But this differs from the evidence in our chapter (Anaximander is not mentioned, a different view attributed to Diogenes in §3). A fuller account of Epicurus' use of the *Placita* given in Runia (2018), where it is argued that Epicurus represents a particularly fascinating case because he is not only prominent in the *Placita* himself, but clearly in his exploitation of earlier philosophical views he has made use of material that would subsequently be distilled into the tradition of *Placita*. An alternative hypothesis is that both Epicurus and the *Placita* independently of each other are dependent on work such as Theophrastus' Φυσικὰ δόξαι, but in our view the correspondences between the two in this chapter are too close, *pace* Sedley (1998b) 165–185, to make this alternative plausible.

C Chapter Heading

All three witnesses in the tradition of P have the same heading (it is all that Q preserves) and S alludes to it in his composite heading for his chapter on the sun. The heading as preserved follows the usual umbrella type Περί x and poses a question relating to the cause, in this case of the motion of a particular entity (cf. ch. 2.16). See further below in section D(c).

D Analysis

a Context

The subject of the sun's motion follows on logically from the previous chapters on its nature, size and shape. Unlike in the parallel sequences on the cosmos (if our conjecture is correct, see the appendix to ch. 2.2) and the stars, there is no chapter Περί κινήσεως ἡλίου. Instead the chapter focuses on the solstices, which in the geocentric model of the universe was the most striking feature of the sun's motion.

b Number–Order of Lemmata

As noted above, the evidence in S adds three doxai to the six in P, making nine in all. It might, however, be questioned whether the final two lemmata following the Stoic doxa are in fact taken from A. The return to the accusative and infinitive construction after the intervening sentence in direct speech is certainly rather harsh. An alternative would be that they form an extract from AD that has been added to the Stoic material. But the final lemma appears to give a Presocratic view, and so is hardly likely to come from this source. It is of course always possible that S has added them from a third unknown location. We might compare the Stoic lemma at S 1.21.3b which was also difficult to

place; see the above-mentioned Appendix to ch. 2.2. Since, however, it is beyond doubt that the lemmata could have been present in A, it is safest to include them in our reconstruction.

Because, except for the group of three lemmata just discussed, S does not preserve any doxa from this chapter in blocks, we have only the evidence of P to help us determine the original order of the doxai. In general P preserves the order of A, though there are exceptions. In M–R 2.552–561 we attempted a rearrangement of the doxai in terms of a systematic diaeretical structure which involved deviating from the order of P. We now think that this attempt was too speculative and will offer an alternative which for the most part retains the order as found in P.

c Rationale–Structure of Chapter

Firstly it should be noted that all the doxai in P and the additional Democritean doxa in S are formulated by means of prepositional phrases answering the question ‘why (διὰ τί) does the sun move between the two solstices’. This is obscured by the bland wording of the heading Περὶ τροπῶν ἡλίου. One wonders whether an earlier heading may have been διὰ τί ὁ ἥλιος τὰς τροπὰς ποιεῖται or even πῶς ὁ ἥλιος τὰς τροπὰς ποιεῖται. It must be admitted, however, questions of this type seldom occur in the cosmological Books 2 and 3, only occurring in the longer titles of chs. 2.19 and 2.30.

Our reconstruction can proceed in the following steps:

(1) The first four doxai in P and S all answer the question in terms of some kind of opposition which causes the sun to stop and turn. The first two involve the air, Anaximenes’ (older) view applying to the heavenly bodies in general. (cf. ch. 2.16), while Anaxagoras refers specifically to the sun. These two doxai clearly belong together, although they are not formulated in opposition to each other. The second can perhaps be regarded as a more developed version of the first.

(2) The next view in P is that of Empedocles, which states that the turnings (τροπαί) occur ‘by the sphere that surrounds it’. It may be best to take this literally. For Empedocles the sun has its own straight movement (εὐθυπορεῖν), which causes it at some stage to bump up against the crystalline mass of the outermost heavenly sphere (cf. A 2.11.2, 2.13.11), causing it to turn. (We owe this explanation to D. Couprie; see further below at (5).) It is followed by the view of Diogenes, which also involves cold (cf. Anaxagoras), but surprisingly the air is not mentioned and the sun is said to be quenched. This does not, however, *pace* Diels *DG* 62 and Laks (2008) 207 have to refer to extinction of the sun (as will be the case for the lemma of Xenophanes on eclipses in ch. 2.24). It could also mean diminution of power. It would be more logical to have this view fol-

low the view of Anaxagoras, as occurs in the sequence of S. We must bear in mind that in his process of coalescence the order is primarily determined by the doxai in ch. 2.20. We will return to this question in (5) below.

(3) The next doxa is attributed to the Stoics, and is well known from other sources (see below section D(d)§7). The movement of the sun and its solstices is determined by the presence or absence of sustenance for the sun through the exhalations of ocean and land. It follows on from Diogenes' view, both emphasising change of circumstances, though of quite a different nature.

(4) The final view in P is the explanation in terms of the standard cosmological model attributed to the heavyweights Plato–Pythagoras–Aristotle. This is the first mention of the role of the ecliptic in the chapter (it was earlier mentioned in chs. 2.9 and 2.12). Here the sun travels its own course along the ecliptic until it reaches the tropics. The role of the latter, stated in terms of 'guardianship' recalls the doxa of Empedocles. For the doxa's place in the chapter see (6) below.

But now the difficult task of integrating the extra material in S awaits us.

(5) It is not possible to determine with any certainty the position of the Democritean lemma, since S has separated it from other doxai in the chapter. A clue might be the parallelism of expression (so loved by A) between it and the Empedoclean lemma: ἐκ τῆς περιφερούσης αὐτὸν δινήσεως and ὑπὸ τῆς περιεχούσης αὐτὸν σφαίρας. This, when added to the link between the lemmata of Anaxagoras and Diogenes above, leads us to deviate from the order in P and place the latter before the view of Empedocles. This allows the two doxai of Empedocles and Democritus to be juxtaposed. For the latter the explanation given is only in terms of the whirling of the vortex. For Empedocles in contrast the movement is straight (εὐθύπορεῖν) until blocked (see (2) above). It would still have to be in a spiral in order to explain the movement up and down. How this spiral movement relates to the role of the vortex in Empedocles' cosmogony and cosmology is not clear and cannot be broached here; see for example the discussion of the baffled Furley (1987) 91–94 (but he does not discuss this text). A further contrast between the two doxai is that Empedocles' view involves the independent movement of the sun, and so anticipates later views in the chapter.

(6) What remains in S is the additional material in 1.25.3i, which is tacked on to the views of the Stoics also found in P. As noted above in section A(2), this text is not found in Diels' text in *DG*, but he noted in the Appendix that it should be added after the Stoic doxa. This does seem a logical move. (It is not likely that it derives from AD, given the extracts from that source (fr. 32–33 Diels) later in the same chapter at 1.25.5. Though S's text does not contain a verb of movement in the first part, διέρχεσθαι can safely be supplied

from P's text. The verb συγκαταφέρεισθαι then continues the explanation of movement. Without the dative the prefix συγ- suggests an additional movement (not concomitant movement as at A 2.13.9–10). This would be the circular movement around the (spherical) earth, in addition to the up and down movement between the tropics, together making a spiral. There is nothing in this description that is not consistent with Stoic views assuming a spherical earth in a spherical cosmos (though, as already noted, the text is not included in *SVF*).

The remaining sentence then contrasts another group (ἄλλοι δέ) who make this movement in a straight line, i.e. not around a sphere, but around a cylinder. The straight movement (ἐπ' εὐθείας) recalls the description in the doxa of Empedocles (εὐθυπορεῖν). At M–R 2.557 we suggested the contrast here was between a vortex model and a centrifocal model. Couprie in a forthcoming article disagrees with this suggestion, but approves of the link with the earlier view of Empedocles (which he develops substantially further). He argues that unspecific reference to 'others' in fact has Empedocles in mind. However this may be, the contrast with the earlier, probably Stoic, view is clear.

The final question is where this additional material should be placed in relation to the doxa of Plato–Pythagoras–Aristotle. It might be thought that the anonymous doxa should come last, as often occurs in A (examples in this book at chs. 2.14, 2.26–27, 2.32). The difficulty here is that it almost certainly follows on from the latter part of the Stoic doxa. But the first part of that doxa, as we saw, follows on well from the earlier Presocratic views in the first five doxai. Moreover, it precedes the doxa of Plato etc. in P. So it will be best to place the latter doxa last, as it occurs in P, even though it is not usual for A to reserve the final position for a really significant view. The reference to 'the sphere' preceded by the word καί ('the sphere too') might be thought to link up to the two references in the other Stoic and anonymous doxai, but here it is the sphere as teaching model that is meant (as illustrated on the famous Naples mosaic), not the shape of the earth or cosmos.

The chapter's structure, as best we can reconstruct it, is rather loose, moving from rather obscure and limited Presocratic views, via the Stoa with its surprising adoption of a view which also has these roots, to the more sophisticated and by A's time generally accepted view of the standard model.

d Further Comments *Individual Points*

§6 We have retained the text in P, which makes tolerable sense. But other Stoic texts explaining the source of the sun's heat only mention the oceanic exhalation, not the earthly one (AD on Chrysippus at S 1.25.5b = *SVF* 2.652, Cleanthes

at Cic. *ND* 2.40, 3.37 = *SVF* 1.504, 501). Indeed in the second text in Cicero it is implied that the reason for the solstices is that the sun turns back on running out of oceanic exhalations to feed on (cf. Hahm 1977, 151). The textual problems in S and the adaptation in G also imply that we do not have A's original text. Wachsmuth's conjecture 'the ocean (and the great sea)' is attractive because it provides an alternative feminine antecedent for ἡς rather than the difficult γῆ. It is just possible that G's mention of τὴν θάλασσαν preserves an earlier text. But if we read θάλασσα instead of γῆ, then there would have been no reference to the ἀναθυμίαςις on land to which G also refers. It is more likely that G gives us a paraphrase of what he read in P. There is little alternative in our view but to print the text as recorded in P.

The Stoic view on the sun's nourishment had Presocratic antecedents, as recorded by Aristotle, who criticizes it sharply; cf. *Mete.* 2.2 353b6–9, 354b34–355a1 (texts below section E(b) General texts). See our comments on A 2.17.4 and 2.20.6. He also mentions and criticizes the view that air causes the solstices (355a24), which brings to mind the views of Anaximander and Anaxagoras recorded in §§1–2.

§7 A cylindrical shape ('like a stone pillar') is attributed to the earth as the doxa of Anaximander at ch. 3.10.2. This doxa would seem to refer to an early Presocratic view no longer preserved elsewhere. As noted above, Couprie links this doxa with §4 and suspects that the view can be ascribed to Empedocles, but there is no further evidence for this.

§8 The weighty triple name-label Plato–Pythagoras–Aristotle is used for the view that represents the dominant standard model of ancient cosmology as developed from the fourth century BCE onwards. The same combination also occurs at A 2.10.1 on the right and left parts of the cosmos and elsewhere at A 4.20.1 and 5.4.2. In the other three cases A follows the chronological order Pythagoras–Plato–Aristotle. Plato perhaps comes first here because of the astronomy of the *Timaeus*; cf. 38e–39a, where the ecliptic and the spiral twist (ἐλιξ, cf. §6) are mentioned, but not the movement between the tropics. But of course Pythagoras is also associated with this work, e.g. at A 2.6.5. It is to be noted that AD includes a separate mention of the motions of the sun in his account of Aristotle's doctrine of the sun at S 1.25.4 (fr. 10 Diels), even though there is no mention of this subject in the *De caelo*.

e Other Evidence

As noted above in section B, Epicurus in giving an account of the τροπαί of the sun at *Ep.Pyth.* 93 gives four possible explanations, all of which can be paralleled with doxai in the present chapter: (1) tilting, cf. Plato–Pythagoras–Aristotle; (2) the resistance of air, cf. Anaxagoras; (3) the presence or absence

of combustible material, cf. the Stoa; (4) the vortex, cf. Democritus (and for the reference to the helix cf. the Stoa and the anonymous view). We note also similarities of vocabulary: κατὰ λόξωσιν (first recorded use of the term) cf. §8; κατὰ ἀέρος ἀντέξωσιν cf. §2; δίνην cf. §5; ἑλικά cf. §§6–7. Epicurus concludes by saying all these theories do not conflict with what is possible (ἐχόμενος τοῦ δυνατοῦ). A could have easily added here Ἐπίκουρος οὐδὲν ἀπογινώσκει τούτων, ἐχόμενος τοῦ ἐνδεχομένου, i.e. a formulation parallel to A 2.13.15 on the stars' substance. Lucretius follows his master at 5.614–649, but gives only two reasons: (1) the whirl explicitly attributed to Democritus (5.621–628, cf. §5); and (2) the pushing of air (5.637–642, cf. §2). Diogenes of Oenoanda mentions the sun's oblique course (fr. 13 Smith).

Commentary

A Witnesses

(1) The tradition of P, fully represented in the Byzantine mss., E and Q but abridged in G, preserves seven doxai. Two doxai, P4 and P5, are copied out in the Platonic scholion, the former verbatim, the latter in a paraphrase. Noteworthy is that the scholiast adds Xenophanes' place of origin (τὸν Κολοφώνιον) and by omitting the word ἕτερον misses the main point of the doxa.

(2) All of P's lemmata can be recovered among S's various coalesced clusters of doxai except the anonymous P4, which he either overlooked or did not think was worth including. Two doxai are recorded which have no equivalent in P, attributed to the Pythagoreans and Empedocles respectively (1.25.1i, 3e). The formulation of the doxa is identical in both cases (ἐκλείψιν δὲ γίγνεσθαι σελήνης αὐτὸν ὑπερχομένης). This is the same doxa as that of Thales in P1 and at S 1.25.3b (without the additional words κατὰ κάθετον), which leads to the surmise that a multiple name-label was present in A. We cannot, however, simply add the two names to Thales in the first doxa, since it is formulated in terms of the πρῶ-

τος εὔρετής motif. But we can conjecture A's original text on an analogy with S's formulation at S 1.26.2 (= 2.28.5–6), Θαλῆς πρῶτος ἔφη ὑπὸ τοῦ ἡλίου φωτίζεσθαι. Πυθαγόρας, Παρμενίδης, Ἐμπεδοκλῆς, Ἀναξαγόρας, Μητρόδωρος ὁμοίως (note that the two name-labels in ch. 2.24 recur in this later chapter, except that Pythagoras replaces his followers). It should also be noted that the final two doxai in P are also the final lemmata in S's extended scheme of coalescence. This strongly suggests that they were what was left over after he had joined together all the other doxai. He could of course have joined the final Xenophanean lemma to the two (or three) others with which he commenced the chapter (S 1.25.1ab), but he must have overlooked it then and made up for the omission later.

B Proximate Tradition and Sources

(1) *Proximate tradition.* On the subject of the sun's eclipse the situation regarding sources for the doxographical tradition differs little from that on the sun's movements. Numerous texts describe Thales' knowledge of eclipses; see the listing in Wöhrle (2014) 28–31. The majority, starting with Herodotus 1.74, claim his ability to predict eclipses. Fewer texts mention his discovery of the cause. Other (non-standard) Presocratic views on the cause of eclipses are rare, but for each of the views in §1 and §§3–5 there is a single parallel in the collections of doxai in Diogenes Laertius or Hippolytus (texts below section E(a)).

(2) *Sources.* The subject of solar eclipses is not discussed by Plato in the *Timaeus* or Aristotle in the *De caelo* and thereafter becomes wholly uncontroversial. Aristotle uses the solar eclipse as a standard example of seeking the cause in his theory of knowledge (*APo* 2.1 89b26, text below section E(b) General texts).

As was the case in the previous chapter, the most interesting source material is located in the Epicurean tradition. In his *Ep.Pyth.* at D.L. 10.96 Epicurus combines explanations for the eclipses of both the sun and the moon. For the sun he only gives two alternatives. The former clearly recalls the first doxa of Xenophanes, using the same key phrase κατὰ σβέσιν. The second involves interposition (the technical term is used) but the text is not entirely clear. Epicurus appears to postulate the interposition of the earth, but also other heavenly bodies, which could imply bodies other than the moon. Similarities with the anonymous doxa in A are certainly present. In addition, a scholion in Diogenes' text indicates that in the (presumably) fuller discussion in his *Περὶ φύσεως* Epicurus also listed the dominant view attributed to Thales in the *Placita*. These three views (quenching, interposition of moon or of another body) are repeated by Lucretius in his poem at 5.753–757. As in the case of ch. 2.23 some kind of link with the anterior tradition of the *Placita* must be assumed.

See further the discussion in Runia (2018) 407–408. But in this chapter too A does not make any reference to Epicurean views.

For the treatment of solar eclipses in Achilles see below section D(e).

C Chapter Heading

There is no essential variation in the witnesses regarding the heading of the chapter in the tradition of P and it is succinctly referred to in S's composite title for his ch. 1.25. Like the previous chapter on solstices, it is a clear example of a question διὰ τί, i.e. seeking the cause. As noted above, in *APo* 2.1 89b26 Aristotle had explicitly given this question as an example of how, after we ask τὸ ὅτι, we then go on to ask τὸ διότι; see further above ch. 1.6 Commentary D(a). So A could have formulated the heading as διὰ τί ἐκλείπει ὁ ἥλιος. He chooses, however, to stick to the standard Περί x type, as he also does in ch. 2.29 on the moon's eclipse. The question is posed in relation to a specific feature of this particular heavenly body (and also on the moon at ch. 2.29).

D Analysis

a Context

The final chapter of the sequence on the sun turns to a subject that is specific to it (and the moon), the phenomenon of its eclipse and how it can be explained.

b Number–Order of Lemmata

Because this chapter is the last that S includes in his coalesced clusters, his presentation can tell us very little about the original order of the lemmata in A, except that the fact that he reserves the doxai of Aristarchus and Xenophanes for the last place before moving on to material from AD confirms that these were most likely the last two in the chapter (as corroborated by P). He could have linked the final Xenophanean doxa with the earlier one (= P5), but did not do so, either because he overlooked it or because it introduced the new subject of multiple suns and moons. It is very probable, therefore, that we have A's chapter complete and that the order as set out by P, with some additions from S, is trustworthy.

c Rationale–Structure of Chapter

The chapter with its eight doxai is not highly structured. Unusually for A, there are no oppositions or obvious diaereses. He starts off this time with the dominant scientific view, represented by the first Ionian, who is also credited with the discovery as expressed in terms of the πρῶτος εὐρετής motif. This was long regarded as completely non-historical and explicable as an extrapolation from his famous prediction of the eclipse during the battle between the Lydians and

the Persians as reported by Herodotus. Guthrie trenchantly states (1962–1981, 1.49) that ‘these achievements were quite impossible for Thales, and his ignorance becomes even clearer when we see the fantastic explanation of eclipses given by his associate Anaximander’. However, the discovery of a papyrus in which this attribution to Thales is claimed by none other than Aristarchus, i.e. two centuries earlier than the previous earliest text in Cicero, has led scholars to reexamine the issue and some are now less sceptical, e.g. Mouraviev in *CPF* 1.238, Lebedev (1990), Burkert (2013), but Zhmud (2006) 241 remains unconvinced. Of course Aristarchus’ claim could have been based on supposition (he must have known the story) rather than any written evidence.

The next doxa in A is attributed to Anaximander, followed by two other Presocratic explanations involving the sun’s fiery nature. In the case of Xenophanes’ doxa in §5 there does seem to be confusion with an explanation of the daily appearance of the sun; see the parallel view on the heavenly bodies in 2.13.14 and the comment in Kirk-Raven-Schofield (1983) 174–175. However, the explanation for eclipses would appear to be confirmed for the doxographical tradition by the evidence in Epicurus and Lucretius discussed above in section B. Thereafter the next anonymous doxa is somewhat reminiscent of the standard view, except that the blocking is done by clouds and not the moon. One might think of the cosmology of Xenophanes, who does much with compressed clouds, were it not for the fact that two other doxai in the chapter are already attributed to him.

The seventh doxa is noteworthy in recording the only cosmological doxa attributed to Aristarchus in the *Placita* (elsewhere only at A 1.15.5 and 4.13.4). It is based on his famous heliocentric hypothesis and so stands apart from all other views (but this is not emphasized). The difficulty is that the inclination of the earth is not relevant to an explanation of eclipses. The doxa would find a much better place in the previous chapter on solstices. However the formulation with the verb *σκιάζεσθαι* demonstrates that its place in A was in the current chapter. This is corroborated by S’s manner of excerpting, as we have noted above.

The final lemma returns to Xenophanes and records another seemingly odd view involving multiple suns and moons in various places. The sun ‘treads on emptiness’ (Bicknell’s translation: 1967, 76, adducing a parallel in Plu. *Flaminius* 10) and its light appears to be eclipsed. If we accept Bicknell’s explanation, the reason is that it passes over an area of the earth where there is no nourishment through lack of moisture. The doxa could then be a further explication of the compactly stated cause *κατὰ σβέσιν* in the doxa earlier in the chapter. However, it can also be linked to the explanation *κατ’ ἀναχώρησιν* in the scholion on Epicurus in D.L. 10.96, i.e. through retirement or withdrawal (cause unspecified).

The doxa is placed at the end because it involves multiple suns *and* moons; cf. the final placement of the Heraclitean doxa at A 2.28.6. The last part of the doxa, however, does not address the topic of the chapter, but just like the previous doxa it would be better placed in a chapter *Περὶ κίνησεως ἡλίου*, part of the subject matter of which is covered by ch. 2.23 on the solstices.

d Further Comments
Individual Points

§1 S does not mention the *πρῶτος εὐρετής* motif in connection with Thales. Most likely he left it out in coalescing the doxa with the one of the sun's οὐσία in 2.20. Given, however, the strength of the tradition on Thales, there is another possibility, namely that P himself added it in the process of epitomising A. But since S includes it for the illumination of the moon by the sun in A 2.28.5, it is much more likely that he dropped it here. Later traditions also make Thales the first discover the cause of the moon's eclipses: cf. Wöhrle (2009) frs. 433–435, 515, 535. But A himself does not mention this in ch. 2.29.

The final phrase of the doxa has given rise to much discussion. Heeren (1792–1801) 1.528 and Diels took τῷ δίσκῳ here to mean an ancient mirror, in which the eclipse can be seen to take place. The verb *vidisse* in Cicero's report at *Rep.* 1.25 recalls βλέπεσθαι and perhaps supports this interpretation. There are two problems. The Greek is somewhat stilted. As Torraca (1961, 452) notes, one would expect ὑποτιθέντι τὸν δίσκον. But doxographical style does not aim at fluency and often shows a preference for an impersonal style (though note πρὸς τὴν ἡμετέραν ὄψιν in §4). A more significant problem is that the term ὁ δίσκος is later used three times in §§6–8 to refer to the sun and not a mirror. But this is at a fair remove from the opening lemma. The text should be allowed to stand. However, the use of two different senses of the same word may help to explain the degree of textual variation.

§7 The final two words τὸν δίσκον are not found in S, and Mau, though leaving them in his text, would prefer them to be removed. He is right to retain them, however, because this text is clearly the *lectio difficilior*. In Aristarchus' surviving treatise on the sizes and distances of the sun and the moon (on which see the Commentary on A 2.21) there is no trace of the heliocentric hypothesis; see further Heath (1913) 310. It has often been thought that the unusual term *κενεμβατοῦντα* ('stepping into an void' or 'treading on emptiness', as interpreted by Bicknell, see above D(c)) goes back to Xenophanes' poem; see for example Kirk-Raven-Schofield (1983) 175, Graham (2010) 125. But the occurrence in A is the earliest preserved instance of the verb.

e Other Evidence

Ach gives only a single view, that of Thales but presented anonymously, in terms quite reminiscent of A but not identical. Moreover he adds an evaluative comment in a favour of this view, which is of course the dominant one. He thus differs from the method employed by A, who does not discriminate, although he does place this view first.

Commentary

A Witnesses

The chapter on the moon's substance is one of the longest in Book 2 and is exceptionally well attested. For the tradition of P there are no less than six witnesses. There is also very full record in S, complemented by extracts in T and some parallel material in Ach and the Aratean tradition.

(1) P records seven doxai. The first attributed to Anaximander is quite long and gives various additional details based on his particular cosmology. It is wholly parallel to the first doxa in ch. 2.20. The remaining six are mainly short. The complete set of doxai is found in E, Q and in an excerpt in Ioannes Lydus. G abridges the first doxa and deletes the final two. The papyrus is very fragmentary but gives evidence on one textual conundrum. As the apparatus shows, in the case of the second, fourth and final doxa there are important textual discrepancies that will need to be examined in detail. For this task the evidence of the remaining witnesses must be taken into account.

(2) As occurred in the case of the doxography on the sun, S combines all the material on the moon in a single chapter. His procedure differs a little, however, no doubt because he concluded that to coalesce seven chapters (compared with five on the sun) would simply be too difficult. So he just takes the first three chapters on the moon's substance, size and shape and combines all the material in them. Since the other two chapters are short, most of the material comes from the chapter on substance. The remaining four chapters are then seemingly written out in full. The procedure thus provides valuable evidence on both S's method and the original appearance of A (see the remarks at M–R 1.218).

Since the following two chapters on the moon's size and shape are short and distinctive, it should be possible to strip the doxai from them away and so be left with the lemmata originally present in 2.25. A complicating factor, however, is that S has clearly mixed in some material from AD towards the end of the coalesced section of the chapter. Stylistic considerations make it highly likely that the lemmata on Aristotle (1h), Zeno (1i) and Chrysippus (1l) derive from AD (but not the lemma on Cleanthes); on these lemmata see further M–R 3.328–329 (but the Aristotelian lemma should be added). We shall argue below that the extract on Aristotle from AD very likely replaces a doxa originally present in A.

If, then, the extraneous material both from chs. 2.26 and 2.27 and from AD is filtered out, the following fifteen doxai remain (doxai present in P are added in brackets):

S₁ Anaximander (= P₁)—S₂ Anaximenes—S₃ Parmenides—S₄ Xenophanes (= P₂)—S₅ Thales—S₆ Anaxagoras Democritus (= P₅)—S₇ Diogenes—S₈ Ion—S₉ Berosus—S₁₀ Heraclides Ocellus (~ P₆)—S₁₁ Pythagoras (= P₇)—S₁₂ Empedocles—S₁₃ Plato (= P₄)—S₁₄ Cleanthes—S₁₅ Posidonius and most of the Stoics (~ P₃).

Clearly it will be a challenge to reconcile this list with the order of the doxai in P.

(3) T follows his section on the sun with a parallel section on the moon. But earlier in T 4.21 he had already coalesced the doxai of Xenophanes on the two heavenly bodies, changing the singular into the plural νέφη πεπυρωμένα (T₁). In T 4.23 he continues with five more doxai which can all be paralleled in S. Significantly, however, he joins up the name-labels of Anaximenes and Parmenides and adds that of Heraclitus to it (T₃; missing in S). It is most likely that these three labels were linked together with the view that the moon is fiery. There are also differences in the order of the doxai when compared with S. T begins with Thales (T₂) and places the doxa of Heraclides (T₆) after that of Pythagoras (T₅; this also differs from P). The doxa of Anaxagoras–Democritus (T₄) is taken over without modification.

(4) On the significant parallels in Achilles and the Aratea see the next section.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The topic of the moon's substance is prominent in a number of texts which stand close to the doxographical traditions used by A. Two occur in Achilles and the *Scholia in Aratum*, showing significant though mostly not very exact parallels to A. These will be discussed in section D(e) below. A third text is found in Cicero's *Lucullus*, where as we saw in the case of ch. 2.21 Cicero draws on an anterior doxographical tradition. The doxa at §123 is clearly parallel to that of Anaxagoras–Democritus in A (note both mention mountains), but it is attributed to Xenophanes. Finally, there are two suggestive texts in doxographical passages in Philo's *De somniis*. At *Somn.* 1.22 Philo writes that some people have said that the heavenly bodies are ἄγκεια καὶ νάπας καὶ μύδρους διαπύρους. This is not specifically said of the moon, but is reminiscent of the doxa of Anaxagoras and Democritus in §10 (but is even closer to the doxa of Democritus at A 2.30.4). In *Somn.* 1.145 Philo also gives a view that is similar to the Stoic doxa in A (note the term χρᾶμα). We may surmise that these passages are drawn from the source that he used extensively earlier in the treatise (see above on chs. 2.11 and 2.13). We return to this text when discussing ch. 2.30 below. Lucian in his satire *Icaromenippus* also refers to questions associated with the moon (substance, size and shape), wittily placing them in the moon's mouth as a participant in the conversation.

Of considerable interest in relation to this chapter (and also chs. 2.28 and 2.30) is the celebrated treatise of Plutarch, *Περὶ τοῦ ἐμφαινομένου προσώπου τῷ κύκλῳ τῆς σελήνης*. Various views are recorded, some of which correspond to doxai in A (Stoics 921F, Empedocles 922C, Aristotle 928E, Thales etc. 936E, Plato 943A), while others differ (Posidonius 929D, Xenocrates 944A). The proposed

view at 922B, εἰ οὖν ἡ σελήνη πῦρ ἐστὶ, recalls the formulation of a θέσις. In fact, the opposition between fiery–light and earthy–heavy, parallel to A's diaphonia, dominates the entire treatise; see esp. 921E, 936E (cited below section E(a) General texts). Ultimately Plutarch seeks a compromise view associated with Plato and Xenocrates (cf. 943F and 945D, and see further on A 2.30). This is also a common doxographical technique. The entire treatise is a splendid example of how doxographical material and techniques can be utilised and absorbed in a highly literary work. It deserves further detailed analysis from this viewpoint. Most of these doxographical parallels are not included in the notes to the edition of Cherniss's edition in Cherniss-Hembold (1957) or are concealed in references to collections such as DK and SVF.

(2) *Sources.* That the nature of the moon was a hot topic of discussion in early Greek philosophy, just like in the case of the sun, is evident not only from the material in our chapter but also from the purported exchange between Socrates and Meletus in the former's speech at his trial (*Apol.* 26d–e). But it is difficult to trace antecedents for the collection of doxai in our chapter. Aristotle scarcely refers to the moon in *De caelo* and furnishes no doxographical material (he does refer to two questions regarding it in his theory of knowledge at *APo.* 2.1 90a3–5, text below). In general, there is less doxographical and dialectical material on the substance of the moon than on that of the sun (we have found no examples of its use as a rhetorical example of a *quaestio* or a θέσις). It is clear, however, that the main diaeresis of A's chapter reflects the main division of opinion on the subject in antiquity; see Préaux (1973) 157. The thorough overview of ancient views in Gundel (1933) 77–84, which is like a modern version of doxography, is organised in a tripartition, beginning with views that the moon is earthlike, followed by views that it is a mixture of elements, and ending with the view that it is composed of fire.

C Chapter Heading

The longer heading found in P^{BQ} and in S (and P^{Sy}) must be the original, as shown by the parallels at chs. 2.11, 2.13 and 2.20. E and G abridge, as they also did in their chapters on the sun's substance (ch. 2.20). As in the parallel chapters, the heading as the common umbrella formulation Περὶ x, indicating a *quaestio* in the category of substance.

S has joined together the chapter headings of chs. 2.25–27 at the beginning of his chapter and inserted the remaining headings of chs. 2.28–31 at the appropriate points within the chapter itself. There is no need to follow Wachsmuth in restoring the latter to the initial chapter heading. This is based on Photius' index, but he could have easily extracted them from within the chapter, as argued by Elter (1880) 72 and Mansfeld (2000b) 182–183.

D *Analysis*

a Context

The doxography on the moon (chs. 2.25–31) follows the same pattern as that on the sun (chs. 2.20–24), starting with a lengthy chapter on its substance. The parallel chapters on the heaven, stars, sun and earth at chs. 2.11, 2.13, 2.20 and 3.9 all include the term οὐσία in their chapter headings (but the chapter on the sun is the only other one to use the formula Περὶ οὐσίας, the others using longer formulations).

b Number–Order of Lemmata

The task is to identify which doxai belong to the chapter (in most but not all cases this is clear) and to reconcile the differences in order between the three witnesses. The starting-point should be the long list of doxai in S, but we must bear in mind that the epitomator P seldom alters the order that he found in A. We proceed in the following steps.

(1) The order in P corresponds well with the order in S, except in the case of P₃ = S₁₄ (Stoics) and P₄ = S₁₃ (Plato). S often moves doxai on Plato, Aristotle and the Stoa to the end of the chapter and sometimes replaces A with extracts from AD. This will have happened here. We should retain P's order for these doxai.

(2) For the second doxa (Anaximander is first in both P and S) T shows that most likely there were three name-labels Anaximenes–Parmenides–Heraclitus. This means that S must have accidentally deleted the Heraclitean view at 1.26.1c (unless the word πυρίνην dropped out of the text). This view is consistent with the Heraclitean doxai in following chapters (A 2.28.7, 2.29.3).

(3) As Wachsmuth saw, S_{5–11} form a block (all with views that the moon is in some way earthy). The view of Xenophanes that precedes in both P and S is to be located earlier in the chapter.

(4) The Empedoclean doxa that follows the block (S₁₂) does not belong with it. It is close to the Stoic view and very likely followed it. S may have overlooked it when he passed over the views of the Stoa and then added it after the block.

(5) In S an Aristotelian doxa follows on from Plato (the two philosophers are often coupled in the *Placita*). Its formulation suggests, however, that it was drawn from AD (it should be added to the list in Runia (1996b) 372–376, repr. M–R 3.322–327). It is very likely that it replaced the original doxa in A, which therefore must be supplied. Our conjectured formulation is based on the similar doxai in A 2.13.12 and 2.20.11.

(6) As noted above, the doxai of Zeno and Chrysippus near the end in S are taken from AD. However, the formulation of the two brief doxai on substance and shape attributed to Cleanthes at S 1.26.1i differs and so they are more likely

to come from A (cf. S 1.26.1cf), to be assigned to chs. 2.25 and 2.27 respectively. The former on the moon's substance precedes the view of Posidonius and the Stoics in S (note the expanded name-label compared with P, who must have compressed here). This order can be retained, the doxa forming a slight contrast with the similar view of Xenophanes, although it is also possible that it followed that of most Stoics as an exception (the option taken at M-R 2.2.580).

On the basis of the above there are 15 doxai in the chapter (very similar to the parallel chapters 2.13 and 2.20) in the following order:

A1 Anaximander—A2 Anaximenes—Parmenides—Heraclitus—A3 Xenophanes—A4 Cleanthes—A5 Posidonius and most of the Stoics—A6 Empedocles—A7 Plato—A8 Aristotle—A9 Thales—A10 Anaxagoras—Democritus—A11 Diogenes—A12 Ion—A13 Berossus—A14 Heraclides—Ocellus—A15 Pythagoras.

This order is fully consistent with that found in P. As noted above in section A(3), T has modified the order in a number of ways.

c Rationale—Structure of Chapter

If the 15 doxai are analysed (and the further comments in the following subsection are taken into account), it emerges that the chapter has a remarkably coherent structure (first pointed out in Runia 1989), which illustrates beautifully a number of common doxographical techniques used by A.

The chapter is dominated by a fundamental diaeresis between the view that the moon is basically fiery and the view that it is primarily made of earth or some solid substance. The leaders of the two views are the venerable Milesians Anaximander (§1) and Thales (§9). After Anaximander there follow three views that the moon is fiery or fire-like (§§2–4). Then there are four doxai in which fire is mixed with other elements (§§5–8). The Aristotelian view coming last in this group might be seen as exceptional, since the quintessence is not fiery in the strict sense. After Thales, leader of the second basic group of views (§§9–15), a number of doxai follow in which the moon is earthy or solid or glassy etc. These views are only loosely organized and contain some quite idiosyncratic positions. There is an obvious link with the subject of ch. 2.30 on the moon's appearance and why it appears to be earthy. See further our Commentary on that chapter.

d Further Comments

Individual Points

§1 For this doxa P and S have very different texts, which are not easily reduced to a single version. It is worth setting out the two texts in detail, cutting them up into their separate components and highlighting what is common to them both:

S1	Ἀναξίμανδρος κύκλον εἶναι ἐννεακαί- δεκαπλάσιον τῆς γῆς,	P1	Ἀναξίμανδρος κύκλον εἶναι ἐννεακαί- δεκαπλασίονα τῆς γῆς,
S2	ὅμοιον ἄρματίῳ (τροχῷ) κοίλην ἔχοντι τὴν ἀψίδα καὶ πυρὸς πλήρη,	P2	ὥσπερ (τὸν) τοῦ ἡλίου πλήρη πυρὸς·
S3	καθάπερ (τὸν) τοῦ ἡλίου, κείμενον λοξόν, ὡς κάκεινον,	P3	ἐκλείπειν δὲ κατὰ τὰς ἐπιστροφὰς τοῦ τροχοῦ·
S4	ἔχοντα μίαν ἐκπνοήν, οἷον πρηστήρος αὐλόν·	P4	ὅμοιον γὰρ εἶναι ἄρματίου τροχῷ κοί- λην ἔχοντι τὴν ἀψίδα καὶ πλήρη πυρὸς,
S5	ἐκλείπειν δὲ κατὰ τὰς ἐπιστροφὰς τοῦ τροχοῦ.	P5	ἔχοντι μίαν ἐκπνοήν.

There are two main differences. (1) S has additional material (κείμενον λοξόν, ὡς κάκεινον, οἷον πρηστήρος αὐλόν), whereas P repeats a phrase (πυρὸς πλήρη). (2) There is a difference in order: compared with S, P has the order P1–4–2–5–3; compared with P, S has the order 1–3–5–2–4. There can be little doubt that S's text is superior. Aside from the superfluous repetition, P also states that the wheel causes the eclipse in P3 before introducing it in P4. S's additional material is not such that it could easily be added on the basis of general knowledge. We note that the phrase οἷον πρηστήρος αὐλόν recalls διὰ πρηστήρος αὐλοῦ in A 2.20.1 (though there the full phrase is only found in P); on the interpretation of this phrase see on ch. 2.20, Commentary D(d)§1. We have thus integrally taken over S's version in our text above. See further Runia (2020).

§3 For the reading here the witnesses are fairly evenly divided by πεπυρωμένον and πεπιλημένον. The evidence for the former is a little stronger than the latter if T is added. It is important to realise that both readings are supported by independent parts of the tradition of P. Remarkably the papyrus, unknown to Runia when writing his 1989 paper, contains the final three letters of the participle. The editor Barns supplemented with πεπυρωμένον, but given the virtually identical length of the two variants, this is arbitrary. It is easy to see that something like the reading πεπυρωμένον πεπιλημένον is required in order to differentiate between the sun and the moon (not understood by T). The strange hybrid reading πεπυρωλημένον in the oldest Byzantine ms. Mosq. 339 can be explained as the result of the superscripting of letters from the

alternative reading (cf. Diels *DG* 16 and the apparatus to Mau's edition) or as the result of haplography, i.e. πεπυρω(μένον πεπι)λημένον. In Runia (1989) 267 it was proposed that both participles must have originally been present in the text and this was approved by Mourelatos (2008) 148 in his fuller analysis of Xenophanes' cosmology. If the succession of participles seems a little harsh, one might adduce the text in Ach, γῆν πεπυρωμένην στερέμνιον ἔχουσιν πῦρ (where στερέμνιον goes with γῆν), but of course this is no parallel for the succession of two passive past participles. The unusual nature of the phrase must have led to one of the participles being dropped. The papyrus tells us this happened already at an early stage. The hybrid reading remains as witness to the original text. For the translation of πεπυρωμένον as 'incandescent' see above on ch. 2.13 Commentary D(d)§13 and ch. 2.20 Commentary D(d)§2.

§7 The reading for the Platonic doxa in S clearly confirms the reading in P^B and Lydus against E and G. It is consistent with, but less accurate than A 2.13.11 and 2.20.7.

§8 On the conjecture here, based on A 2.13.12 and 2.20.11, see section D(b) above.

§12 This is the only appearance of Ion of Chios in the *Placita*. See the note on unique name-labels at ch. 2.17 Commentary D(d)§3. Brief discussion in a collective volume on Ion by Baltussen (2007) 308–310.

§13 Berossus the Babylonian (fl. 330 BCE) is only cited in the *Placita* in relation to the moon; cf. also A 2.28.1, 2.29.2. He is thus not a Presocratic, but like them has an interesting and idiosyncratic view, for which our doxographer always shows an interest. The astronomical fragments of Berossus are controversial. These doxai may have been drawn from his Βαβυλωνιακά, but Jacoby, followed by recent scholars, regarded them as a late Hellenistic invention; see now De Breucker (2012) and the further discussion at ch. 2.28 Commentary D(e).

§14 The name-label Heraclides in S is confirmed by T (P has Heraclitus, an easy mistake, esp. in the light of a similar doxa attributed to the latter in A 2.28.7). There is no reason to follow Diels *DG* 100, 216 and 356 in supposing the name of Ocellus was added by S. Admittedly this is his only appearance in the *Placita*, but he occurs elsewhere in doxographical material (e.g. S.E. *M.* 10.316, Philo *Aet.* 12). We note also Ἡρακλείδης καὶ οἱ Πυθαγόρειοι in A 2.13.14.

§15 The readings in the tradition of P involving a fiery body are most unlikely to be correct given the structure of the chapter noted above in section D(c). T's reading πετρῶδες σῶμα is not impossible. But in two nearby chapters there are Pythagorean doxai involving reflection (A 2.20.13, 2.30.2), so S's reading κατοπτροειδὲς σῶμα inspires confidence. It is also supported by the doxa in the *Scholia in Aratum* (see section D(e) below). The readings in the P tradition can be explained as corruptions of the original reading preserved in S.

e Other Evidence

In a most interesting parallel passage Ach at the beginning of his chapter on the moon presents seven doxai. Although not specifically linked to the subject of its οὐσία, this is clearly what they discuss. These doxai have a complex relationship to what is found in A, regrettably offering little help for the task of reconstructing his original chapter. The doxai are all but the last presented anonymously and are mainly very brief:

Ach1. The denial of the moon's existence is a remarkable doxa. It can be explained as a mechanical application of the originally Aristotelian question types, of which the first is εἰ ἔστιν, whether something exists or not. Cf. A 1.7 on the gods and 1.24 on generation and change; see further M–R 2.1.169. Aristotle actually uses the moon's existence as an example at *APo.* 2.1 90a5 (text below). Another explanation might be that the moon we see is only a phantasm or a reflection.

Ach2. Not in A, but equivalent to A 2.20.5–6 on the sun.

Ach3. Equivalent to the doxa of Anaximenes–Parmenides–Heraclitus in A.

Ach4. Parallel to the doxa of Posidonius and the Stoics in A.

Ach5. Presumably the Platonic view; cf. Ach ch. 11 on the stars, but there he adds πλείστου δὲ πυρός.

Ach6. Basically equivalent to the Anaxagoras–Democritus lemma in A. The mention of the Nemean lion is also found in a scholion on Apollonius Rhodes' *Argonautica*, where it is linked to the flat surface of the moon (see on ch. 2.27). The report is also anonymously mentioned by Plutarch *Fac.* 937F in connection with the moon's velocity.

Ach7. Quite different from the Empedoclean doxa in A (the view has already been mentioned in ch. 16, 23.16 Di Maria on the order of the seven spheres, where it is joined up with fr. B45 DK).

There is a further scrap of material in the *Scholia in Aratum*. The first doxa is basically that of the Stoics (the term σύγκριμα reappears in the Stoic doxa at A 2.30.6 on the moon's appearance; we note also κρᾶμα at Philo *Somn.* 1.145). The second doxa most interestingly gives us a parallel for the reading of S in the Pythagorean lemma found in all three witnesses (§15). There can be no doubt that this material comes from a shared tradition.

Commentary

A *Witnesses*

(1) All the witnesses to the tradition of P reveal only two doxai, the former relating the moon's size to the earth, the latter to the sun. In the case of G it would seem that the epitomator decided to join up this chapter with the preceding one. As argued by Mansfeld (2000b) 180 and followed by Jas, there is no justification for following Diels in interpolating the missing title and so restoring a separate chapter 67a. G can make this change because he has modified the title in ch. 67 (~ P 2.25), omitting the word οὐσίας.

(2) The two doxai in P are also found in S, with an additional doxa relating the view of Aristotle. On Bottler's suggestion that contamination has occurred here see below D(c).

(3) T continues his very compact presentation of views on the moon. He has four doxai, all presented anonymously. Of these the first and third clearly correspond to those of the Stoics (in P and S) and Aristotle (in S). The second differs from what we find in P and S, not comparing the moon's size to that of the sun but continuing the comparison with the earth. The final doxa is not found elsewhere in the doxographical tradition.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The question of the moon's size is raised or discussed in the doxographical tradition and related texts less frequently than that of the sun. It would appear that other aspects of the moon were regarded as more interesting, especially its eclipse, illuminations and appearance. For example, in his *Ep.Pyth.* at D.L. 10.91 Epicurus states that the sun and the stars are the size that they appear, leaving out a reference to moon (Usener and Marcovich added <καὶ σελήνης> to the text but this is not followed by Dorandi, whose explicit aim is to edit Diogenes and not Epicurus). The subject is not mentioned by Ach in his chapter 21 on the moon. There are some indications, however, of a broader doxographical tradition than what we find in A. Cicero, Plutarch and Galen (texts below) all refer to 'the scientists' (οἱ μαθηματικοί) who have treated the subject. Cicero's measurement is rather inexact (more than half the earth's size), but Plutarch gives for Aristarchus a much more accurate estimation (dia-

meter smaller than 60 to 19 and larger than 108 to 43). Its source is known to us, namely the extant treatise of Aristarchus 'On the sizes and distances of the sun and the moon'. Plutarch also records a view of Anaxagoras that it was as large as the Peleponnese, i.e. a *doxa* that clearly recalls his view in A 2.21.3 that the sun is many times the size of the Peleponnese (this text is missing in DK), as well as a measurement by some Egyptians (i.e. priests?). It would appear that Plutarch has put together this list of opinions himself; the Anaxagorean *doxa* may have been taken from a *Placita*-style doxography, but this is less likely for the other two views.

(2) *Sources*. Though there is much evidence that early philosophers and scientists discussed the subject of the moon's size—both Thales and Anaximander are described as having been the first to treat it (see texts in Eudemus and Diogenes Laertius cited below)—, the record of their findings is lost. Plato and Aristotle do not mention it in their extant writings, in spite of the *doxa* in the present chapter (see below section D(d)§3). Advances were made by the astronomers Eudoxus, Aristarchus and Hipparchus. The results of these investigations are visible in the manual of Cleomedes, who uses them to carry on a polemical discussion with Epicurus (note his tell-tale use of the term *ποδιαίος* at *Cael.* 2.3.81, cf. ch. 2.21 on the size of the sun). For overviews of ancient views on the subject see Gundel (1933) 84–86, Pease (1958) on Cic. *ND* 2.103, Préaux (1973) 202–271. In these accounts A is not treated as a separate source.

C Chapter Heading

The heading, parallel to that on the sun in ch. 2.21, is of the usual *Περὶ x* type and poses a *quaestio* in the category of quantity. It is the same in all extant witnesses of the tradition of P (as noted above, it is missing in G) and is confirmed by S, who has combined the chapter headings of chs. 2.25–27 (on S's coalescence of A's chapter headings in his chapter on the moon see above on ch. 2.25 Commentary C). We note also that Ps has coalesced the two chapter headings on size, chs. 2.21 and 2.26, and added the size of the earth which is not discussed in A's Book 3 as transmitted to us (though the subject is implicit in the Xenophanes *doxa* at A 3.9.4). As noted above in section A, G appears to have coalesced the contents of the two chapters 2.25 and 2.26 (a rare procedure on his part), altering the heading to the more general *Περὶ σελήνης* and so deleting the equivalent heading for ch. 2.26 in P.

D Analysis

a Context

As in the case of the sun, the question of the moon's size follows on from that of its substance.

b Number–Order of Lemmata

This chapter is one of the rare occasions that T records a doxa not present in the two primary witnesses P and S (the other examples are in chs. 4.3 and 4.5). The order that he gives is compatible with that of P and suggests that the Aristotelian doxa was placed third in A's list of views. There are, however, no parallels anywhere for his final anonymous view that the moon is the width of a span. It is neatly parallel to the Heraclitean doxa on the sun in ch. 2.21 (the span as the distance from the tip of the thumb to the tip of the little finger is a slightly smaller measure than a foot, but there is no evidence that Heraclitus or anyone else held this view on the moon's size). Moreover it might be regarded as suspicious in that the span is a common biblical measure. In Is. 40:12 LXX it used rhetorically as a measure for the heaven, a text which T quotes on six occasions. But its position here is very apposite and from the formal point of view it represents a typical doxographical lemma, so there is no real reason to be overly suspicious (we revise our view in M–R 2.590). One might compare the doxai on the motion of the cosmos that T presents in 4.16, which we discuss in the Appendix to ch. 2.2. The status of those lemmata is more questionable, however, because there it is necessary to postulate that a whole chapter has fallen out, and so in contrast to the present lemma we have not included them in our reconstruction. For a passage in Lucretius that may shed light on this doxa see section D(e) below.

c Rationale–Structure of Chapter

The chapter gives a brief list of four views not dissimilar to the method used in ch. 2.21 on the sun (there is no final 'epistemological' Epicurean doxa this time). But the list gives rise to a major difficulty when its rationale is analysed. The first Stoic doxa compares the size of the moon to that of the earth, the same procedure as used in ch. 2.21. The second Parmenidean doxa, however, proceeds differently and compares the moon to the sun, not the earth. It then adds the comment that it is illuminated by the sun, which is the subject of a later chapter (2.28). The view is in itself unobjectionable; cf. the statement at Cleomedes *Cael.* 2.3 64.19 Todd that the apparent size of both sun and moon is 12 inches. But the doxa interrupts the comparison of the moon's size with that of the earth in the first and third doxa. This is not the case in T, where the first three doxai all compare the moon and the earth and we have a perfectly logical set of alternatives going from large to very small. There are at least three ways in which this surprising sequence can be explained:

(1) The doxa in P and S goes back to A, but is inconsistent with his usual diaeretic method. T perceived this and adapted it to a more acceptable list. It

was easy to do this because all of his doxai are anonymous and it is clearly the views that are important for him, not fidelity to his source.

(2) The doxa in P and S does not go back to A, but a mistake has crept into the tradition. The reference to the moon's illumination by the sun should belong in ch. 2.28. It is a consequence of the original mistake of comparing the moon to the sun and not the earth. T thus represents in a paraphrased form A's original intention. This interpretation is put forward by Bottler (2014) 454, who argues that contamination has here occurred between P and S. This drastic conclusion is, however, far from necessary if T has normalised the diaeresis, as argued above. Another possibility, suggested by Jas in an unpublished review of Bottler, is that the transmission of A diverged on this point early on and the one version was used by PS, the other by T. We regard this possibility as less likely than that T altered the text *suo Marte*.

(3) The text in both P and S is partially defective (the result of an early corruption) and originally read Παρμενίδης ἴσῃν <τῇ γῇ ὥς καὶ> τῷ ἡλίῳ. We note that the first doxa also includes a comparison with the sun. The additional comment in the second half of the doxa might have originally been a gloss. Compare a comparable confusion between sun, moon and earth in A 2.31.1.

There seems little alternative but to retain the text as transmitted by both P and S, unsatisfactory though it appears to be. Emendation is, we believe, not justified.

d Further Detailed Comments

Individual Points

§3 This eminently sensible doxa is found nowhere in Aristotle's extant works. As we noted in our discussions on the sources for chs. 2.20 and 25, he does not give the sun and moon much individual attention in the *De caelo*. It is also not found in the spurious *De mundo*. It is possible that this view was put forward in one of his writings that is not longer extant.

§4 The use of ἄλλοι or ἄλλοι δέ for the final doxa of a list is not common in A, but can be paralleled at A 2.23.9, 2.27.6, 2.32.10, 5.17.6, 5.23.3. There are no further examples in T, so this could be taken as an argument for his doxa being derived from A rather than added by himself.

e Other Evidence

In a set of 10 lines on the size of the moon Lucretius strongly emphasizes that it is exactly the size that it seems (*DRN* 5.575–584, text below section E(a)§4). This is similar to what he, following Epicurus, says about the sun, but he does not allow for a margin of error as his master is reported to do in the case of the larger body (cf. A 2.21.5). Bailey (1947) 1410 wonders why the question of the

source of the moon's light is already introduced here prior to the main discussion in *DRN* 5.705–730. His answer is that, if the moon is an illuminated object, it will have a perfectly clear contour and therefore will be seen exactly as it is. As in the case of the sun, neither the philosopher (in our extant sources) nor the poet give an example of the kind of size it could be. But as we noted in our detailed comment on A 2.21.5, Epicurus' view was often aligned with the Heraclitean doxa that the sun was the size of a foot. Analogously, it is possible that the comparison with a span in §4 preserved only by T could have the same background, going back either to Heraclitus or to Epicurus. But there seems to be no actual evidence to support this surmisal.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

(1) All the witnesses in the P tradition have four lemmata (except in Q, where through haplography only the title is preserved). As in the previous chapter, the Stoic doxa is placed first, and it also contains a comparison with the sun. The remaining three doxai all give alternative shapes indicated by a single adjective. In all four cases the adjective has the form $x + -\epsilon\iota\delta\acute{\eta}\varsigma$, which was also extensively used in the parallel chapters 2.2 (earth), 2.14 (stars) and 2.22 (sun). There is a difference in the order of the doxai. In P^B the Empedoclean doxa precedes that of Heraclitus, in E and G this order is reversed. In addition after the final anonymous doxa G includes a long section on the various shapes of the moon's phases, which is important evidence that he occasionally inserts additional material among his selection of the *Placita* (though in the case of shorter texts this is not always certain).

(2) The evidence in S has to be disentangled from his coalescence of the three chapters 2.25–27. Unlike ch. 2.26 this chapter includes the doxa of Heraclitus (S₁). The view of Empedocles and the anonymous view are coupled together (S₂–3), supporting the order in E and G against the Byzantine mss. A little further on we come to two doxai attributed to Cleanthes. In the previous chapter we argued that these derive from A. The odd view (S₄) that the moon is cap-like ($\pi\iota\lambda\omicron\epsilon\iota\delta\acute{\eta}$) is reminiscent of the exceptional Cleanthean view on the stars' shape at A 2.14.2, where they are cone-shaped ($\kappa\omega\nu\omicron\epsilon\iota\delta\epsilon\iota\varsigma$). There it follows the Stoic lemma as an exceptional view. This is possible here, but it could have also had a place in the list of non-spherical views. Finally S cites the Stoic view that the moon is spherical (S₅). The longer name-label including Posidonius belongs to ch. 2.25 and should not be retained here. Unlike in the case of ch. 2.26 S does not include the additional remark drawing the analogy with the sun. It is more likely that S left it out than that P added it to A, so it should be retained. S then adds a section (S₆) on the phases of the moon similar but much shorter than that found in G (and cf. Ach). They cannot be reduced to each other: G begins with the new moon, S with the full moon. We agree with Diels that it should be retained for A. Unlike the sun, the moon also has multiple shapes through its phases. There is no need to suspect contamination between G and S here, since G had access to doxographical traditions both earlier and later than and differing from A (see M–R 1.144).

(3) T at CAG 4.24 only gives a general reference to the subject without citing any doxai. He speaks of shapes in the plural. This enables him to summarize a number of chapters in his source.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Only a limited number of texts give doxographical accounts of the moon's shape. Diogenes Laertius and Plutarch mention the non-standard Empedoclean view that it is 'disc-like' (and also in Plutarch 'bean-shape,' φακοειδής). The same doxa is also found in Ach, where only two views are recorded, those of the Stoa and Empedocles in a simple diaeresis indicated with a μέν ... δέ construction. All three texts may ultimately be derived from an earlier doxographical tradition shared with A. Philo in a text located at *Mut.* 67 states that the surveyor of the heights (μετεωροπόλος καὶ μετεωρολογικός) will investigate not only questions relating to the sun (see on chs. 2.21 and 2.23) but also the moon's illuminations and shapings through decrease and increase. This treatise precedes *De somniis* with its important doxographical summary (see on ch. 2.11), so this text may point to treatment of the subject in the same source. We should also note (1) that Quintilian and Lactantius indicate that the subject of the moon's shape is a *quaestio generalis*, i.e. a θέσις, and (2) that the fact that there are seven phases of the moon is exploited in the arithmological tradition (Nicomachus, Clement of Alexandria, Anatolius etc.).

(2) *Sources.* Unlike in the case of the sun (see on ch. 2.22 Commentary B) Aristotle states explicitly that the moon is demonstrated to be spherical through the evidence of sight. The reason for this mention is obviously the fact of its phases, in which it does not always appear to be spherical. He adds that it is further proven through astronomical facts because solar eclipses are moon-like in shape. Cleomedes too connects the moon's phases with its spherical shape (*Cael.* 2.5.24–39, text below). He does not give alternative shapes, except that he notes the impossibility of its having a two-dimensional shape (σχῆμα ἐπίπεδον), i.e. using a mathematical term rather than the 'disk-like' shape found in the doxographical tradition (cf. §3 on Empedocles and above on Diogenes and Plutarch). The long passage on the illumination of the moon in Gregory of Nyssa is also more likely to be based on a scientific than a doxographical account, as for example in the Handbook of Geminus. It gives no alternative views; see text below section E(b) General texts and further on ch. 2.28.

C *Chapter Heading*

There can be no doubt that the heading is simply Περὶ σχήματος σελήνης, parallel to chs. 2.2 and 2.22 (2.14 has the plural because of the multitude of stars or galaxies). It would appear that G also has the full chapter heading, contrary to the text printed by Diels. Jas (2018a) 200 notes that it is found in ms. O and confirmed by Nicolaus' translation (both not used by Diels). On T's plural (σχημάτων) see above section A(3). The heading itself is of the usual Περὶ x umbrella type, asking a question in the category of quality. This title is the last one that

S has conflated in the heading of his chapter 1.26 on the moon. The remaining chapter titles are inserted into the text, starting with that of ch. 2.28 at S 1.26.2 Wachsmuth.

D *Analysis*

a Context

As in the case of the sun, the question of shape follows that of size. The difference between the two heavenly bodies is that the moon has two kinds of shapes, one as a body, another through its phases.

b Number–Order of Lemmata

In addition to the four lemmata presenting four different shapes in P, S includes one more shape for the moon as a body (Cleanthes). He then adds a brief section on the phases of the moon, which as argued above in A(2) should be included in the chapter. The parallel texts in G and Ach, though not derived directly from A, suggest a common doxographical origin and so support the view that this topic also belonged to the material discussed in the chapter. The placement of the sentence in *oratio obliqua* after the first Stoic doxa, as in S, can be accepted. This would mean that the doxa of Cleanthes is not presented as an exceptional view, unlike in 2.14.2. There are thus six doxai in all. The only remaining question is the divergence between P^B on the one hand and E, G and S on the other on the order of the doxai of Heraclitus and Empedocles. Priority should be given to the majority reading, unless there are significant structural reasons for departing from it. The appeal of Bottler (2011) 286 to the evidence of Ach in this question is misguided, since it is outweighed by the more direct evidence of the other witnesses. The fact that P and Ach agree is not an argument in favour of P's order, firstly because Ach is not derived directly from A, and secondly because Ach only has two doxai. See also further Bottler (2014) 460.

c Rationale–Structure of Chapter

The chapter begins with the Stoic view, which of course corresponds to the mainstream position on the topic. It is striking that in all five chapters on the shape of the major cosmic bodies, the Stoics are chosen to represent the spherical view (coupled with Thales in 3.10) and that in all but 2.22 they are placed first. The following doxa adds the shapes that occur during the phases of the moon. These are, from the viewpoint of the observer, modifications of its spherical shape depending on the illumination it receives from the sun (i.e. related to the question to be discussed in the following chapter). As noted above, parallel texts from Aristotle onwards link up the topics of the moon's shape and

phases, as is only to be expected. The remaining four doxai all give alternative non-spherical shapes in a list. All of these have to be in some way circular to account for the observed phenomena. The main diaeresis is thus between the mainstream spherical view and the remaining non-orthodox views (this is also suggested by the parallel in Ach and its use of μέν ... δέ), which can be summed up under 'other (circular) shapes'. For the similar diaeresis on the shape of the earth see on ch. 3.10. Bottler (2014) 461 suggests an alternative diaeresis between one phase, multiple phases and phases in comparison. While not impossible, it is less likely because A does not emphasise the contrast between a single and multiples phases.

d Further Comments

Individual Points

§2 A (and also Ach and G) uses the standard terminology for the phases of the moon, as can be seen from the descriptions of Nicomachus of Gerasa, Clement, Cleomedes and Geminus (texts below section E(b) General texts). The reference to 'the scientist Seleucus' in Clement is noteworthy. He makes two rare appearances in the *Placita* at 2.1.7, 3.17.9.

§4 The term πιλοειδής is extremely rare. Apart from its use here it is only found in three medical texts (Soranus *Gyn.* 1.14.1, Oribasius *Coll.Med.* 24.31.24, 48.50.1). The primary meaning of πῖλος is 'felt' (Beekes 2010, 1190), so perhaps the comparison is with a felted product such as a (round) hat, thereby explaining that the moon appears to have a surface that is slightly rough rather than smooth and uniform like the sun. It is thus better to translate 'hat-like' rather than 'cap-like' (as at M–R 2.2.599 following LSJ).

e Other Evidence

The question may be posed, given the fact that by time A's the view that the moon was spherical was universally accepted, where the alternative views in our chapter come from? Some clearly derive from the early periods of Presocratic thought, in which A is always interested (Heraclitus and Empedocles). However, as was the case in the chapter on the shape of the cosmos (see ch. 2.2 Commentary B), it is also possible that the list may have been influenced by dialectical argument. As already noted, Aristotle argues that if the moon were not spherical, it would not be possible to explain the visible evidence of its phases. He does not, however, give any alternative shapes. Some are supplied by Simplicius in his Commentary, but these (drum-like and bean-like) are not the ones found in A. But in an astronomical papyrus located in Paris the alternative examples given are precisely two shapes in our chapter (δισκοειδής and σκαφοειδής); see the text below in section E(b) General texts. We note that this

dialectical argument combines views on the moon's shape as a body and the apparent shape of its phases, just as occurs in the present chapter.

Commentary

A *Witnesses*

For the remaining chapters of Book 2, i.e. chs. 28–32, we are in the virtually unique position of having them transmitted to us in exactly the form that they appeared in A's handbook (only the final lemma in 2.32 is missing). It would appear that for chs. 28–31 S became weary of the process of coalescence that he had carried out for the chapters on the stars, the sun and (so far) on the moon. There is every indication that in the remainder of S 1.26 he has written these four chapters out separately under their titles (ch. 32 had been written out earlier in S 1.8 on the nature of time). We thus have a unique opportunity to study the way A constructed his chapters and how they were excerpted in their very different ways by P and T. Contrary to our usual fashion, therefore, in the case of these chapters we must start with S.

(1) S records seven doxai. Their sequence is quite unproblematic.

(2) Of the seven doxai in S four remain in P. We note the following manipulations:

- (a) In his first doxa P combines elements from §1 and §2 in S. This could be the result of a kind of haplography, or perhaps P decided there was little difference between them and they could be conflated, particularly if 'dimmer' is taken to be 'dimmer compared with the sun'.
- (b) S's third doxa is deleted by P, no doubt because it adds little (we already know that the moon is 'air-like' from ch. 2.25).
- (c) The fourth doxa of Antiphon is copied out with perhaps a minor change; see below, section D(d).
- (d) For the next two doxai (which must be read together) P drops the πρῶτος εὐρετής motif for Thales and characteristically shortens the long list of name-labels to καὶ οἱ ἄπ' αὐτοῦ (exactly the same occurs in 2.1.2).
- (e) The final doxa in S is copied out in its entirety by P.

It emerges therefore that P has excerpted almost all of the chapter, yet two (or three if S_{5–6} are split up) doxai are obscured. G goes much further in his excerpting, preserving only P's first and third doxai (which do give the main

diæresis). We note that G further reduces the name-labels in the latter doxa to Thales only. On the other hand, Lydus writes out all four of P's lemmata, only abbreviating the final doxa.

(3) T has not made use of this chapter.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Two texts at Philo *Somn.* 1.23 and 1.53 give insight into pre-Aëtian traditions on this topic not mentioned in Achilles. The latter text includes the chapter's title and gives a brief diaphonia of the two main positions: the moon shines with light derived from elsewhere or it has its own light. The former has the same division, but then introduces a third, compromise position in which the moon's light is a mixture of the sun's and its own light. On the earlier doxographical tradition on which these texts are based see above Commentary on ch. 2.11 section B. Extensive dialectical-doxographical parallels confirm that the two Philonic texts mentioned above represent standard approaches to the topic. The single diaphonia in Philo's second text is found in Epicurus, Lucretius, Cicero, Vitruvius, Apuleius and Augustine (texts below section E(b) General texts). The tripartite schema appears, albeit not very clearly, in Plutarch's *De facie* (on which see our Commentary on ch. 2.25 section B). It is also found in Cleomedes' Stoic manual of astronomy, on which see further on §3 in the Detailed comments below, D(d). On the early texts in Epicurus and Lucretius see section D(e) below. For the Patristic authors Irenaeus and Arnobius the topic of the moon's phases belongs to the standard questions of natural philosophy: see Book 1.proœm. 3 *Exempla physica* and texts below section E(a).

(2) *Sources.* The subject of this chapter exercised the thinking of the early philosophers to a considerable degree, as can be seen in quotations from the poems of Parmenides and Empedocles and the prose work of Anaxagoras (texts quoted by Philo and Plutarch cited below under section E(a)§6). Plato credits Anaxagoras with the discovery that the moon derives its light from the sun, but does not pronounce on the matter himself. The question also remains unclear in Aristotle; see the note on §2 below in section D(d).

C *Chapter Heading*

The witnesses agree on the heading, which is of the simple umbrella Περί x type, though in fact the chapter treats the sub-question of source or origin (πόθεν, *unde*) of the question type cause; see further our Commentary on ch. 1.6 section C. S now discontinues his practice of conflating headings and places the heading of this chapter as a sub-title within his ch. 1.26, altering it slightly by adding the connecting particle δέ and replacing σελήνης with αὐτῆς. The equivalent ch. 2.17 for the stars uses the formula with the term πόθεν, i.e. πόθεν φωτίζονται οἱ ἀστέρες.

D *Analysis*

a Context

Our author proceeds to the next subject relating to the moon, the source of its light, which follows on from its substance (ch. 2.25) and its phases (ch. 2.27), but precedes discussion of its eclipse (ch. 2.29). Unlike in the case of the sun, however, its illuminations can be linked to but do not necessarily follow directly from its substance as discussed in ch. 2.25. Given the controversy on the source of the moon's light, the doxographer felt the need for a separate chapter, which does not have an equivalent in the case of the sun, though as we saw the subject is also discussed in the case of the stars (ch. 2.17).

b Number–Order of Lemmata

Because of the method used by S for this chapter, the number and the order of the lemmata are not in doubt.

c Rationale–Structure of Chapter

The main diaeresis of the chapter is between the view that the moon has its own light and that it receives its light from the sun. It is the same diaeresis as in the second Philonic text and is found in many other texts (see sections B above and D(e) below). The two groups are led by the venerable Milesians Anaximander and Thales (note that the order is not chronological but systematic, for the view that it has its own light is logically prior). The same main representatives and non-chronological order were used in ch. 2.25. For the first view Berossus, who elsewhere is often cited as its chief representative (see the parallels listed below), is placed after the two early Presocratics. The extreme brevity of the second and third doxai make them difficult to interpret. The Aristotelian doxa is basically a refinement of the opening lemma, taking into account the natures of the two heavenly bodies. *Pace* M–R 2.605 ἀραιότερον here must mean 'thinner, sparser' (cf. chs. 2.7.1 and 2.7.3, where the comparison is with πυκνός, 'dense'). Grammatically the adjective appears to describe the moon's light, but it makes more sense to refer it to the moon's composition in terms of the fifth element (cf. A 2.25.8). The Stoic view could also be a restatement of the first doxa. But more likely it relates to the third (compromise) view in the first Philonic text and other Stoics texts. The moon's dim appearance would be the result of a mixture of its own bodily nature and the light of the sun (but see the detailed comment in the next sub-section and also further below). It would thus be a compromise view. It has to be admitted, however, that the exact meaning could not have been clear to A's reader. For these two lemmata his desire for brevity has most likely obscured the systematics of his source. In the case of the fourth doxa attributed to Antiphon we also appear to have a compromise

view: the moon's own light is obscured by the more powerful light of the sun that shines on it and it reflects. The verbs ἀμαυροῦσθαι and ἀμαυροῦν would pick up the adjective ἀμαυροφάνης in the Stoic doxa and reinforce the interpretation that these two views are compromise positions that supply a transition to the second major branch of the diaeresis. However, the final words of the doxa sit uneasily with this interpretation. As noted by Pendrick (2002) 297, the doxa could also be interpreted as explaining why the moon is (largely) obscured during the day, as also happens to the other heavenly bodies (for which reflection of the sun at night does not make much sense). Here too the doxographer does not make the meaning very clear for his reader.

The doxa whose discovery is attributed to Thales, that the moon receives its light from the sun, was the dominant view in antiquity. No doubt the impressive list of name-labels is meant to underline this dominance. It is surprising that A does not use the characteristic formulation of 'bastard light' that occurs in Philo and in various parallel texts (see texts below). In addition he also does not refer to the theory of Empedocles comparing the moon's reflection of light with what occurs in a mirror (cf. Philo *Prov.* 2.70, *Plu. Fac.Lun.* 929E).

The final Heraclitean lemma might appear to belong to the first group of the diaeresis, since the moon's light comes from the moist exhalation in its bowl, just like in the case of the sun. The difference is that the moon's light appears 'dimmer' (ἀμαυρός again) because of the murky air in which it moves compared to the brighter air for the sun. It is placed at the end most likely because it compares the sun and moon. Such comparisons involving the two planets are found at the end of three other chapters (2.20, 2.24, 2.30). The final placing may also be due to its 'epistemological' nature, i.e. dependent on how the two bodies appear to the observer (πρὸς τὴν φαντασίαν). We might compare the way that Epicurus' 'modal' views are placed at the end of chs. 2.2, 2.4, 2.13.

In various sources it is argued that there is a direct relation between the question of the moon's phases and the source of its light. But the argument is worked into two opposing directions. At Cleomedes 2.4.56–78 Todd and Plutarch *Fac.Lun.* 929F–930E, we read that if its light were due *only* to reflection of the sun's light, it would not be visible during some of its phases. On the other hand, Geminus *Elem.* 9.1–10 attempts to use observations to demonstrate the (by his time) dominant view that the moon receives its light from the sun, while Gregory of Nyssa in a lengthy passage at *An.Res.* p. 17.4–18.19 Spira argues that observation of the phases of the moon demonstrates that it does not possess its own light (see below section E(b) General texts). This is the kind of material that is not found in A, who following his usual practice does not comment on the doxai that he juxtaposes to each other.

d Further Comments

General Points

The main diaeresis of A's chapter is recognised in modern scholarship, e.g. by Graham (2013) 88 who even goes so far as to introduce an adaptation of the doxographical terminology, i.e. distinguishing between idiophotism and heliophotism. See further ch. 2.29 Commentary D(d). There has in recent scholarship been extensive discussion of the origins of the view that the moon receives its light from the sun. Wöhrle (1995a) concludes that Anaxagoras deserves the credit for the discovery, since according to our sources (esp. Plutarch) he developed the theory most clearly, though it is possible that Parmenides promoted it in his poem. The tradition that Thales discovered it must be a retro-projection, while its ascription to Anaximenes by Eudemus must also be mistaken, even though it appears to stand in the Theophrastean tradition. For the texts cited by Wöhrle see below section E(a) and (b). Graham (2013) 89–92 also discusses the list of philosophers in A's doxai §§5–6. He discounts Thales and Pythagoras, but is inclined to privilege the contribution of Parmenides. In a very full discussion Couprie (2018) 195–218 reaches a wholly different conclusion, arguing that in the general context of Anaxagoras' astronomy the statement that 'the moon receives its light from the sun' probably means that the moon's light is ignited by the sun. On this theory of kindling, already suggested by O'Brien (1968) see further on ch. 2.30 Commentary D(d)§5.

Individual Points

§2 At chs. 2.11.5, 2.13.12, 2.20.11 and 2.25.8 (very likely) A had on each occasion stated that according to Aristotle the heavenly bodies consisted of the 'fifth body' without any further qualification. Given the placement of these doxai in the various diaereses (esp. the proximity to Plato's view), it may be assumed that A thought this body was similar to fire and had its own luminosity (*pace Cael.* 2.7 289a20–35). The present doxa may be a further deduction on the part of A or his predecessors. There is a single Aristotelian text that hints that the moon may contain some admixture of fire, *GA* 3.11 761b21. AD in his passage on the sun (fr. 10 Diels), however, denies that the sun or any other of the heavenly bodies is fire. But for Aristotle's views on lunar eclipses see further on A 2.27 Commentary B(b), 2.29 Commentary B(b), D(d)§8.

§3 Cleomedes, in arguing for the Stoic position, gives a doxographical overview of three positions (2.4.1–30 Todd). The first of these is that of Berossus (as in A). The second is that the moon is illuminated by the sun, like what happens with mirrors. The third view, which is regarded as 'sounder' (ὕγιεστέρα), argues that the sun's light produces a luminous effect in the moon's substance (a mixture of fire and air) which can remain even when the sun's light is removed

and is thus a better theory that the one of reflection (see the notes of Bowen–Todd 2004, 137–139). This is thus a kind of compromise view, but more subtle than Philo's one of mixture or that of Antiphon in A. The Stoic view in A is not presented clearly enough for the reader to deduce the view presented in Cleomedes.

§4 To describe Antiphon's position S says the moon is ἰδιοφεγγή, P that it ἰδίῳ φέγγει λάμπειν. The compound adjective used by S is a hapax, occurring only in this text, but it seems very much a *vox doxographica*. Both the compressed style and the avoidance of verbs are characteristic of doxographical style. Moreover S is less motivated to alter the text than P. So we retain S's text in this case. It is prudent, however, to retain πυρός in the phrase πεφυκότος τοῦ ἰσχυροτέρου πυρός since it have easily dropped out of S's text. On the doxai of the sophist Antiphon in the *Placita* see our comment at A 2.20, Commentary D(d)§4.

e Other Evidence

The early texts of Epicurus and his follower Lucretius are of considerable interest. Epicurus *Ep.Pyth.* at D.L. 10.94–95 states the two main positions and argues that both are consistent with unspecified analogies from our own experience. On this text see Runia (2018) 408 and further on ch. 2.29 Commentary B. Lucretius offers that same diaeresis at *DRN* 5.575–577, in which the contrast between 'bastard light' and 'its own light' is exactly the same as that found in Philo's first text (cf. also Lucian and Apuleius, who cites the poet's lines). But at *DRN* 5.705–750 he goes into more detail, giving four explanations which combine the questions of its light and its phases (see also ch. 2.29). It is noteworthy that the third of these views is the *Babylonica Chaldaeum doctrina*, i.e. the view of Berossus, which is also used by other authors to represent the position that the moon has its own light (Vitruvius, Apuleius, Cleomedes, Augustine). We note that Epicurus does not refer to the doxa of Berossus in his text. It is possible that some of Epicurus' doxographical material was drawn from the work of Theophrastus; see Bakker (2016) 58–61; Runia (2018) 404. For chronological reasons, however, it is unlikely that the Eresian mentioned the view of Berossus. As argued in Runia (1997) 101–102, Epicurus cannot have referred to him in his *De natura*, the work that was Lucretius' main source, because it was written relatively early in his career, before the *Babyloniaca* became available. Sedley (1998b) 90–91 contests this view, arguing that we do not know that Berossus' cosmological views became known to Hellenistic readers through that work. However, we do not know of any other works available in Greek, and indeed—as noted above on A 2.25.13—some scholars incline to the view that Berossus' fragments 'bear all the characteristics of a falsification of the late Hellenistic period taking advantage of a prestigious name' (Daroca 1994, 96, citing

Kuhrt 1987, 43–44, cf. also the most recent edition by De Breucker 2012, 588–595, 606–609). This is a subject that we cannot pursue further in the present context.

In conclusion, the evidence suggests that Lucretius, as well as following his master, also made use of doxographical traditions that developed during the Hellenistic period. See Runia (1997), and on his psychological theories Mansfeld (1990a) 3143–3154 and Introduction to Book 4, section 5.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

(1) S continues the method initiated in the previous chapter and writes out A's chapter in full. He records nine lemmata. Of these the final one (S9) rouses suspicion because it *alone* repeats the subject of the chapter and is moreover entirely superfluous when added to the previous two doxai. We shall argue below that it is added from AD.

(2) P preserves six of S's lemmata, leaving out just two shorter doxai, but omitting or modifying various name-labels (on his procedure see M–R 1.187):

- (a) For S3 only the name-label of Heraclitus is retained, a very reasonable move considering that the doxa presents specifically Heraclitean doctrine as already introduced in 2.27.3 and 2.28.4.
- (b) In relation to S4 P does not have the reference to the source of the doctrine in the writings of Aristotle and Philip of Opus, while for S5 the name-label is slightly simplified. It is difficult to determine here between the

alternatives: (1) S has added to A or (2) P has abridged A. Mansfeld has argued (2016a, 302) that the reference ‘may ... have been interpolated by S’. But this reference differs from those at S 1.18.1c (cf. A 1.18.6) and S 1.23.2 (cf. A 2.11.5), since—as Mansfeld acknowledges—there is no mention of Aristotelian book titles as in the other two references and one may well wonder where he found the information on Philip of Opus if not in his source. So it is safer to give the preference to S and leave the reference in our text.

- (c) The doxa of Xenophanes that follows on (= S6) is deleted.
- (d) For S7 = P6 the variations in the name-labels are intriguing. P surprisingly drops Thales and Anaxagoras from the list found in S, but adds Aristotle.
- (e) P drops the additional Anaxagorean doxa (= S8) and also does not record the final lemma (S9).

The text in E carelessly coalesces the first two doxai and shows a number of other textual variations. G reduces the chapter to only the first, third and sixth doxa. Psellus retains the title and opens his chapter with a few words that might be a paraphrase of P’s final doxa. The remainder contains a non-doxographical scientific account more similar to what is found in Geminus or Cleomedes. Symeon Seth utilises only the title.

(3) T only indicates that there was a treatment of this subject in his source A, speaking about ‘eclipses’ in the plural, i.e. relating to both the sun and the moon.

B Proximate Tradition and Sources

(1) *Proximate tradition.* Brief doxai on the subject of lunar eclipses are found in doxographical sources such as Diogenes Laertius and Hippolytus (texts below section E(a)§§1, 3, 7). Most interestingly, early evidence is found in Epicurus. But, unlike Aristotle, he prefers multiple possible explanations to a single definite theory. In his summary treatment in *Ep.Pyth.* he distinguishes clearly between the question of the phases of the moon (treated at D.L. 10.94) for which three explanations are given, and its eclipses, dealt with in 10.96 taking sun and moon together, for which two explanations are given. There are various correspondences with the doxai in A’s 2.28–29, e.g. rotation (στροφή) of the moon’s body (2.29.2), configurations of the air (2.28.7), interposition of bodies (2.29.7–8), quenching (2.29.5–6). Three of these are the same as in Aristotle, though for interposition he uses the noun προσθήκησις. We note that he uses the formula with κατὰ no less than six times, the same formula that is prominent in A. On these texts see further Runia (2018) 408. Lucretius follows his master’s lead in *DRN* 5.762–770, giving three explanations and also noting the link with the question of whether the moon shines with its own light or not.

As we already saw in relation to ch. 2.28, these texts reveal a debt to the early doxographical tradition, which explains the loose parallelism with the material found in A. Philo at *Prov.* 2.71 still mentions multiple explanations, but then goes on to give only the standard view, as do all other texts from Cicero onwards, except when referring to early thinkers.

(2) *Sources.* The evidence of the material discussed above gives clear indications of early discussion on the causes of eclipses, but the original texts have not survived. The information will have been collected and transmitted primarily through the Peripatos, as the three references to sources which the chapter—rather unusually—contains indicate; on these see below section D(e). By that time, however, the cause was no longer in dispute. Aristotle himself in his *Analytica Posteriora* uses the example of the moon's eclipse or its waxing as a standard example of finding the middle term, which thereby provides the explanation (text below section E(b) General texts). Interestingly, however, in the first two texts he speaks of interposition only as the cause, but in the third text at 93b5–6 he gives three possible causes: interposition, turning (i.e. Heraclitus' view) or extinction (Xenophanes). This can be regarded as a precursor of a doxographical list albeit without name-labels.

C Chapter Heading

The heading is of the usual umbrella type Περί x, asking a specific question involving causation relating to the moon. As in the case of the chapter on the eclipse of the sun (2.24) there is no variation in the witnesses except T's use of the plural ἐκλείψεων. This is either because he is referring to the eclipses of both sun and moon, or because he is speaking in general terms. There is no reason to conclude with Bottler (2014) 468 that the plural refers specifically to the phases of the moon. As in the case of the previous chapter, S places the title within his chapter on the moon which coalesces A's 2.25–31.

D Analysis

a Context

The theme of the moon's eclipses follows on logically from that of its illuminations. Moreover, because as we shall see the chapter also returns to the subject of its phases, there is a link with ch. 2.27 on its shape.

b Number–Order of Lemmata

The only question to be resolved here is whether all nine lemmata in S are taken from A. As we shall see in the following section, it is almost certain that the final lemma has been added from another source, in all likelihood AD.

c Rationale–Structure of Chapter

The chapter contains a great difficulty which impedes a clear structural analysis. Although its title suggests that the chapter will treat views on the (irregular) eclipses of the moon, its contents also include material relating to the moon's (regular) phases. As we shall see below (section D(e)), the same double treatment occurs in Ach, who quite unambiguously relates the moon's 'failure' to its monthly cycle (κατὰ μῆνα δὲ ἐκλείπει). The combination of subjects does not appear to derive from a double meaning of the noun ἔκλειψις, as suggested at M–R 2.613. Bakker (2013) 686 argues convincingly that there is no evidence that the noun ἔκλειψις is ever used in association with the moon for anything other than the technical sense of a lunar eclipse, and that elsewhere it is never used for its phases as found in A and Ach (the verb ἐκλείπειν is a different matter; see our comment below, section D(d)§1). The distinction is clearly made in another doxographical text, when Hippolytus says that Anaxagoras was the first to distinguish eclipses and illuminations (*Ref.* 1.8.10, text below), and of course the distinction is made in the chapter itself in §7 (τὰς μὲν μηνιαίους ἀποκρύψεις, τὰς δ' ἐκλείψεις).

It should also be noted that there are clear links with the previous chapter on the moon's illuminations. Of the sixteen name-labels in the two chapters (omitting that of Chrysippus) ten are held in common (see the table in M–R 2.616). In addition Anaximander and Thales both play a significant role in starting the list and representing the main 'scientific' views respectively. This suggests that the main diaeresis that dominated ch. 2.28, namely whether the moon has its own light or receives it from elsewhere, may play a role in this chapter too.

The opening three doxai all assume that the moon has its own source of light. A does not state explicitly whether these explanations refer to eclipses or phases. In the case of Anaximander the explanation of blockage is the same as for the sun's eclipse in A 2.24.3 (but differs from the doxa on the moon at A 2.25.1; see also the detailed comment below). But in the case of Berossus' doctrine it must be the phases that are being explained. Heraclitus is recorded as using his hypothesis of the boat-like shape to explain both phenomena (cf. D.L. 9.10), but the addition of καὶ τὰς περιλίσεις (not in P) also suggests that it is the phases that are explained here. The final three doxai (including that of Chrysippus) all refer to the standard explanation of a lunar eclipse by the interposition of the earth (and also other bodies for Anaxagoras). Here it must be assumed that the moon receives its light from the sun. The addition of Chrysippus is entirely otiose and doubles up on the name-label of the Stoics in §7. When we add the stylistic feature (not decisive by itself) that S only here repeats the subject of the chapter, it may be concluded that this final lemma in S has been added from elsewhere, and most likely from AD (and so should be added to the

list of AD's fragments; see M–R 3.332, 583). As in ch. 2.28 the long list of name-labels in §7 is no doubt meant to underline that this is the dominant view.

There remain the three intermediate doxai §§4–6. These appear to relate to the diaeresis of ch. 28 in a chiasmic fashion. The first Pythagorean view is similar to the dominant view, but adds the interposition of a counter-earth. It patently relates to the lunar eclipse. The younger thinkers, in contrast, posit a theory of gradual inflammation and quenching, similar to the view of Xenophanes which is tagged on to it. These latter two doxai can only explain the phases of the moon. So by adhering to the chronological order of the two groups A has run counter to the logical sequence of the doxai and obscures the similarity between the views of the younger group and Anaxagoras later in the chapter. On the identity of the two groups in §§4–5 see below section D(d).

It must be concluded, therefore, that the combination of two different subjects in this chapter, lunar eclipses and lunar phases, has led to a lack of clarity, not to speak of confusion, with a structure that could easily be improved. It would not have been difficult to move §4 to the latter part of the chapter, but A apparently chose to keep the two groups together in a chronological sequence.

Bakker (2013) in a thorough analysis of the material of this chapter (building on our earlier treatment) argues that the present chapter is a conflation of two successive chapters in A's *Vorlage*, the former on the moon's concealments, the latter on its eclipse. The clear distinction between the two subjects is shown in the treatment of Epicurus and Lucretius outlined above. Since the same conflation occurs in Ach (see below section D(e)), the confusion must have already been present in the earlier tradition (or *Vorlage*?) which they share. To this might be added the observation that A often 'pedantically' (to use the Dielsian term) divides up what was kept together in his *Vorlage*. Bakker's arguments are persuasive, but our task in the present work is to reconstruct and analyse what A has left us, not to speculate on his adaptation of antecedent sources.

d Further Comments

General Points

The confusion noted in the previous section is not confined to the ancient world, but has also been present in modern discussions. Clarity is provided by Graham (2013) 87–88, who, as noted on ch. 2.28, distinguishes between ascribing to the moon 'idiophotism' (i.e. self-illumination) and 'heliophotism' (i.e. solar illumination), the former being an active process, the latter merely passive. With regard to the latter theory, further distinctions could be made, e.g. whether the illumination is caused by reflection or by other means, as in the Stoic theory to be discussed under §3 below. Graham then in relation to eclipses uses the Greek term 'antiphraxis' to describe the theory of the block-

ing of the sun's light (of course it applies to solar eclipses as well, where the moon does the blocking). He notes that the two theories are related in a certain way. Heliophotism does not of itself entail antiphraxis, because the sun could lose its light (Xenophanes) or the moon suffer eclipse because a cloud covers it (Anaximenes). But antiphraxis does presuppose heliophotism because it accounts for lunar eclipses by having the earth (or another body) block the moon's source of light. He concludes: 'Thus heliophotism is a necessary condition for antiphraxis and antiphraxis a sufficient condition for heliophotism. In a certain sense, antiphraxis exploits the insights of heliophotism to explain eclipses phenomena. It builds on heliophotism as a foundation.' See also the earlier article of O'Brien (1968). On the term ἀντίφραξις see further our comments at below on §4.

Individual Points

§1 In the fuller account of Anaximander's views on the moon in A 2.25.1 more information is given on how it 'fails' (ἐκλείπειν) than here. The reference to 'turnings' (ἐπιστροφάι) and not blockages indicate that the doxa has lunar phases in mind, not eclipses as in this chapter. (Bakker does not refer to this text.) For a very clear instance where the verb ἐκλείπειν must mean 'failure' in a cosmological context see Psellus' comment in §128 on the sun: οὐ κυρίως ἔκλειψις ἐπὶ τοῦ ἡλίου λέγεται—οὐ γὰρ ἐκλείπει ποτὲ τὸ ἡλιακὸν φῶς—ἀλλ' ἐπισκότησις; cf. much earlier Geminus *Elem.* 10.2 who says the true term should be ἐπιπροσθήσεις ('placings in front').

§2–3 A frequently uses prepositional phrases with κατὰ to indicate causation; cf. also 2.4.12, 2.19.1, 2.24.4–5, 7, 2.25.1 (the last four all in relation to eclipses).

§4 For the explanation of the eclipse the witnesses are divided between the accusative and the dative (both are possible) and between one noun and two joined by καί. That S and P^Q have just the single noun is no doubt the result of coincidence (cf. M–R 1.159). The reading ἀντιφράξει in S will no doubt be the result of the running together of the two nouns, e.g. ἀντ(αυγεία καὶ ἐπ)ιφράξει. But this conceals whether his source read ἐπι- or ἀντι- for the prefix of the second noun. In the context of eclipses the term ἀντίφραξις, meaning obstruction through anteposition, is much more common. The other term ἐπιφραξις means obstruction through blockage and is used by Hippolytus *Ref.* 1.6.5 for the Anaximandrian doxa in §1 where A used the equivalent verb. Despite the evidence of P^{BE} and its being the *lectio difficilior*, Diels is almost certainly right that G's use of ἀντίφραξις points to the correct reading in this Pythagorean context (but the dative can be retained in light of S). We thus revise our reading in M–R 2.621.

§§4–5 The two name-labels, τῶν Πυθαγορείων τινές and τῶν νεωτέρων τινές, both expressed with use of the indefinite article, have generally been taken, at least since Diels *VS* (cf. most recently Laks–Most 4.319), to represent two groups of Pythagoreans. The phrasing of the name-labels does not support this view. It can be argued, however, that A would not have broken the logical sequence of his doxai (as argued above in the previous section) unless there was a special reason for keeping the two groups together. Burkert (1972) makes no reference to the second doxa.

§7 Of the five name-labels two are missing in P (Thales and Anaxagoras) and one in S (Aristotle). The presence of the former two can hardly be doubted (cf. ch. 2.28). The case of Aristotle is more difficult. Did S omit or P add? Here too the presence of an Aristotelian doxa in ch. 2.28 favours the former. S may have wished to add a passage from AD but then did not find what he was looking for. It is surprising that Empedocles is not included, contrary to A 2.28.6.

It should also be noted that P has used the adverb συμφώνως after the four name-labels in the nominative and it is presumably meant to be taken with all them (four in P's case), whereas S uses it with the dative for the scientists, so that the first four named philosophers agree with them. The parallel with the use of the nominative at A 5.30.4 (only in P) and of the similar adverb ὁμοίως at 1.30.2 and 2.28.6 has led us to opt for P's usage, thus disagreeing with Bakker (2016) 128, who prefers the dative. See further on ch. 1.7.23, Commentary D(d).

§8 Couprie (2018) 167–194 argues convincingly that this theory is incompatible with that of the previous doxa and that, in the light of Anaxagoras' theory of the origin of the Milky Way at A 3.1.7 which assumes a flat earth, it must represent his genuine and only explanation for the lunar eclipse. His suggestion (p. 187), however, that it was added to this chapter by S who found it in another source that referred to Theophrastus runs counter to what we know about the anthologist's method.

e Other Evidence

This chapter is quite exceptional in making reference to no less than three sources for the contents of its doxai. The mention of Aristotle's ἱστορία might have the text at *Cael.* 2.13 293b21–24 in mind, as suggested by Huffman (1993) 246, or to the lost Περί τῶν Πυθαγορείων (Ross includes it as fr. 16 in his fragment collection). The reference to Philip of Opus will be to his work Περί ἐκλείψεως σελήνης cited by the *Suda* Φ 418 (the same title as the heading of this chapter except the order of the nouns). The third reference to Theophrastus will be either to his *Physics* (cf. 2.20.5) or to the Φυσικαὶ δόξαι (as Diels thought, including it as fr. 19 in his fragments). But the earlier references will not have entered the tradition *via* Theophrastus, since he appears never to have referred directly

to Aristotle. They will have been added in the tradition later. There is another reference to Aristotle's lost work at S 1.18.1c, but we have argued against Diels in our Commentary D(e) on ch. 1.18.6 that the passage in which it occurs was most likely derived from AD rather than A. None of the references are confirmed in P's epitome, so as noted above in section A, the possibility cannot be excluded that one or more of them were added by S.

Ach includes four doxai on the eclipse of the moon in his chapter on that body, placing them straight after his treatment of its shape (see above ch. 2.27, Commentary B(a)). In the first doxa, in contrast to A, he immediately makes clear that he is speaking about the monthly phases and then refers to the view of Heraclitus (~ S3). Diels' conjecture *σκαφοειδοῦς ὀχήματος* is tempting here, since one would expect an allusion to the Ephesian's characteristic doctrine. The second anonymous lemma clearly describes the doxa of Anaximander (~ S1). But the next doxa reverts to the classic explanation of a lunar eclipse (~ S7) and finally, to increase the confusion even further, it is pointed out that it only happens when the moon is diametrically opposite the sun, which occurs monthly too. This of course is a necessary but not a sufficient cause of a lunar eclipse.

Commentary

A *Witnesses*

(1) In this chapter, as in the case of the previous two, S appears to write out the chapter he had in front of him in full. There is, however, one difficulty that gives rise to suspicion. The doxai ascribed to Anaxagoras (§3) and Parmenides (§5) have an almost identical common element. This might suggest an original multiple name-label, which S may have split up. We analyse these lemmata further below, section D(b).

(2) P preserves only three doxai of the original nine. His modifications can again be easily tracked.

(a) On the longer title compared with S see below section C.

(b) In the first doxa the name-label is the simpler οἱ Πυθαγόρειοι. S's longer version τῶν Πυθαγορείων τινὲς μὲν, ὧν ἐστὶ Φιλόλαος is to be preferred (P often abridges name-labels). It is difficult to choose between the two sets of opening words, P's γεώδη φαίνεσθαι τὴν σελήνην versus S's τὸ γεωφανὲς αὐτῆς εἶναι. If the longer version of the title is chosen (see below C), then P's words simply repeat the title, whereas S's words offer a variation on it. We opt for S in this case. See section D(d)§1 below

(c) P then records the third doxa attributed to Anaxagoras, but appears to shorten it by leaving out parts of both the first and the second sentence.

(d) Of the remaining doxai P writes out only the Stoic doxa (S6). The text is unaltered (on the textual problem in P^B see detailed comments below).

Of P's three doxai G preserves only the first two.

(3) T makes no reference to this chapter.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* From references in Diogenes Laertius and Hippolytus we know that there was discussion on the nature of the moon's earthlike surface in reports on Anaxagorean doctrine (see texts below section E(a)§§3–4), but it is not certain that this was connected to the question of its face-like appearance

from the earth. Welcome evidence in Philo, however, has preserved an anonymous doxa (text below section E(a) General texts) with patent similarities to the doxai of the Stoics and Aristotle in A (§§6–7) which does refer explicitly to the moon's face (πρόσωπον). The emphasis on the 'mixed' nature of the moon (οὐκ ἄκρατον, κράμα) is parallel to the same emphasis in §§5–8 of A's chapter. It is very likely that this Philonic material goes back to the anterior doxographical source used elsewhere in his treatise *De somniis* (see above on ch. 2.11, Commentary B).

Plutarch's famous treatise on the face in the moon focuses in its entirety on the subject of this chapter. The use of the participle ἐμφαινόμενου in the title of the work recalls the chapter heading in A, but like Philo it also refers to the moon's face (πρόσωπον), which is missing in A. Many passages can be adduced which contain material that is parallel to A's doxai. Unfortunately the beginning of the dialogue is lost, but when it commences the speaker Sulla asks whether the conversation should revert 'to those δόξαι concerning the face of the moon which are current and on the lips of everyone' (920B, text below section E(a) General texts). Plutarch replies that 'in obscure and difficult investigations, when common and reputable and customary accounts do not persuade, one should try those that are more unusual.' This seems like a covert reference to the kind of more archaic material recorded in some of A's doxai. For the various parallels that can be found see a selection in the apparatus below. The subject of the precise relation between Plutarch's playful dialogue and the doxographical tradition deserves a fuller study than we can give it here. It should be noted that the diaeresis between fiery and earthy views that is prominent in chs. 2.25 and 29–30 is also a key to his treatment. In addition, for Plutarch the notion of mixture is crucial and it provides the ultimate solution to the question posed by the dialogue: see the doxa of Xenocrates at 943E inspired by Plato, ἄστρου σύγκραμα καὶ γῆς, and the analogy between soul and the moon in the final words of the treatise (945D), τῶν ἄνω καὶ κάτω σύμμιγμα καὶ μετακέρασμα.

It should also be noted that the first two of A's doxai reappear in a very compact form the moon's speech in Lucian's satire *Icaromenippus*, which we have already cited in relation to A 2.25–27. It is not too fanciful to surmise that Lucian knew a doxographical source similar to A.

(2) *Sources.* Aristotle briefly refers to the face of the moon at *Cael.* 2.8 290a27 when he says it is always facing the earth, but does not discuss the reason why it has the face that it does. Other discussions are uncommon. For example, no atomist texts (including Epicurus) mention the face of the moon. For later texts which may record doxographical material see section D(e) below.

C Chapter Heading

The Byzantine mss. of P have a longer heading for the chapter than S. It is confirmed for P by E (who often abridges but not this time) and Q, as well as by G who bases his title on the second half missing in S. It is possible that it was added on the basis of the first lemma in the P tradition (but not in S), as pointed out by Mansfeld (2000b) 180. As in the case of the two previous chapters S places a version of the heading within his longer chapter on the moon, *Ecl.* 1.26. He exhibits the same heading (except the added δέ) as the first part of P, but without the additional phrase. It is difficult to decide whether P lengthened or S shortened. An additional factor is the difference between P and S when they repeat the subject of the chapter in the opening lemma. If we opt for the *lectio difficilior* in S (see further below D(d)§1), then it becomes very possible that the additional title in the phrase has been added by P. In general it is more likely that the epitomator would retain what he found in A rather than lengthen it. It is true that we have to take into account that elements of a text can be modified and developed in the course of the centuries, but the agreement of all four witnesses of P is significant. (In this regard the present chapter differs from ch. 2.20, where only two of the main mss. of P^B have the longer title.) A further problem arises with the pronoun. It is found in the headings of both the representatives of P (except Q, who writes ‘des Mondes’, but he may have modified his original) and S, but if it goes back to A, this would make this chapter different from any other in the sequence 2.20–31 in not referring specifically to the sun or moon (cf. also 3.9–15 on the earth). The probability is that both P and S had their own reasons for abridging just slightly by means of the pronoun. On the basis of the above considerations we retain the title as in P, but substitute *σελήνης* for *αὐτῆς*. It must be recognized that this is one of those cases where it is quite impossible to reach certainty on what A actually wrote. The formula *διὰ τί*, indicating cause, recurs in the titles of a number of headings in Book 5 (chs. §§9, 14, 18). But there are no other examples of a heading which combines this formula with the most common umbrella formula *Περὶ x*. The question involved is again specifically in relation to the moon. Its formulation emphasises appearance rather than substance, for this reason asking for the cause (*διὰ τί*), but the question of substance as presented in ch. 2.25 continues to play a role.

D Analysis

a Context

The question raised in the chapter is peculiar to the moon, so finds no equivalent in earlier chapters on the heavenly bodies. Its subject is closely related to that of chs. 2.25 (substance) and 2.28 (illuminations). We note that all the

name-labels in the present chapter also occur in one of both of the earlier two except the astronomers in §8 (but they appear in ch. 2.29) and the slight change from Pythagoras to Pythagoreans.

b Number–Order of Lemmata

As noted above, S appears to write out the chapter as he found it in his copy of A. But there is a difficulty. The lemmata §§3 and 5 seem to contain a reduplicated element, as can be seen as follows:

§3 Ἀναξαγόρας ἀνωμαλότητα τοῦ συγ-
κρίματος διὰ τὸ ψυχρομιγῆς ἅμα καὶ
γεῶδες, τὰ μὲν ἐχούσης ὑψηλά, τὰ δὲ
ταπεινά, τὰ δὲ κοίλα¹· καὶ παραμεμί-
χθαι² τῷ πυροειδεῖ τὸ ζοφῶδες, ὦν τὸ
πάθος ὑποφαίνει τὸ σκιερὸν³. ὅθεν ψευ-
δοφανὴ λέγεσθαι τὸν ἄστέρα.

¹ τὰ μὲν ... κοίλα not in P || ² S, παραμεμίχθαι
γάρ P^{BE} || ³ ὦν ... σκιερὸν S, not in P

§5 Παρμενίδης

διὰ τὸ παραμεμίχθαι
τῷ περὶ αὐτὴν πυρώδει τὸ ζοφῶδες·
ὅθεν ψευδοφανὴ
λέγεσθαι τὸν ἄστέρα.

Bottler (2014) 478 suggests that we may have a case of ‘Clusterbildung’, i.e. coalescence here. What she means exactly is not entirely clear, but the suggestion is valuable in that it may point to what happened during the transmission of the text. It is clear that the first part of the Anaxagorean doxa (up to κοίλα) links up well with the following doxa of Democritus. This coheres perfectly with the doxa at A 2.25.10 that the moon has ‘plains and mountains and ravines’, where the two name-labels are conjoined. The remaining part of §3, including the words ὦν τὸ πάθος ὑποφαίνει τὸ σκιερὸν, would then not originally have belonged here, but was mistakenly copied out in anticipation of the Parmenides doxa in §5. In M–R 2.628 we suggested that the error might have been made by A. Certainly the evidence of P indicates that it occurred very early before he compiled his epitome. If this analysis of the text is accepted, then there are still nine doxai in all, but the third needs to be shortened, as we have done in our text. See further below section D(d)§5.

c Rationale–Structure of Chapter

The structure of the chapter is not strongly systematic. But it is apparent that, as noted above in section C, the question of substance discussed in ch. 2.25 continues to play a role, and in particular the basic diaeresis between fiery and earthy views of the moon’s substance exerts an influence on this chapter. The order of the two groups of views is, however, reversed. The first four doxai all relate

to the 'earthy' view, as is made very clear in the opening lemma. In the second group of four (§§5–8) the fiery or etherial nature of the moon is implied, but is not made very explicit. Only the final doxa, involving another comparison between the sun and the moon, falls outside the diaeresis. The main diaeresis of ch. 2.28 between the views that the moon has its own light or is illuminated by the sun plays a much lesser role in the chapter, but is relevant to the second group of four doxai.

In the first group (§§1–4) the opening doxa of the Pythagoreans (including Philolaus) makes the moon as earth-like as possible. It is inhabited by plants and creatures just as in the case of the earth, but these are fifteen times the size of their equivalents on earth. No doubt this last detail is based on the further view that the lunar day is fifteen times the length of the earthly day. On this doxa see further the extensive commentary in Huffman (1993) 270–276, who concludes that there is no reason to doubt its authenticity and that its details most likely do go back to Philolaus himself. The emphasis on the earth-like nature of the moon is continued in the doxai of Anaxagoras and Democritus, which expand on details already introduced at A 2.25.10. There A uses a double name-label for a single doxa. Here the two names are separated. The Democritean view relates more directly to the earlier doxa. The Anaxagorean doxa is expanded and explains the unevenness of its composite substance through the cold mixed into its composition (an analogy with solidified lava?). The heights, depths and hollows clearly relate to the 'glens and vales' of Democritus' view. There remains the second doxa in the first group, related to the first doxa in a μέν ... δέ construction. Since the view fits in well with the doxa ascribed to Pythagoras in A 2.25.15 (moon as a mirror-like body) it might be concluded that these 'others' are also Pythagoreans. Diels, perhaps influenced by the attribution of exactly the same theory to the Peripatetic Clearchus in Plutarch (text below section E(a)§2), did not include it in his collection of Pythagorean material in *VS.* Wehrli (1969²), 80 argues that Clearchus, like Heraclides, may have shown Pythagoreanizing tendencies.

In the second group (§§5–8) the Parmenidean doxa forms the transition to the 'fiery' views (note τὸ πυρῶδες familiar from A 2.25.7). The doxa itself does not indicate what the dark component (τὸ ζοφῶδες) is, but if we compare A 2.7.1, it must be the air. This forms an excellent transition to the doxai of the Stoics and Aristotle, which are very similar to each other, the difference being that in the former the air is mixed in with fire (cf. A 2.25.5 but not made clear here) and in the latter with the fifth element (cf. A 2.25.8). In the last doxa in the group the dark patches are also attributed to irregularity of mixture (cf. §3), but this time they are explicitly related to the reflected light of the sun, recalling the main diaeresis of ch. 2.28 between idiophotic and heliophotic light.

The final Xenophanean doxa has no direct relation to the rest of the chapter. It joins three other final doxai that all contain joint statements about the sun and the moon (A 2.20.15, 2.24.9, 2.28.7). See further our comments above on the structure of ch. 2.28 (D(c)). The second of these is also attributed to Xenophanes, while the contrast between ‘lighter’ and heavier also occurs in A 2.20.15. It is probable that earlier versions of the doxographies on the sun and the moon contained some comparative material on the two bodies (perhaps even a separate chapter), at least some of which A wished to include in his compendium.

d Further Comments

Individual Points

§1 As noted above, the opening words of the lemma differ quite markedly in S and the P tradition. S’s τὸ γεωφανὲς αὐτῆς εἶναι διὰ τὸ περιρικεῖσθαι τὴν σελήνην might be seen as a paraphrase of P’s γεώδη φαίνεσθαι τὴν σελήνην διὰ τὸ περιρικεῖσθαι αὐτήν. But, as Mansfeld (2000b) 181 (= M–R 3.453) points out, γεωφανής is an extremely rare word, used in the sense of ‘looking or shining like the earth’ in only this text (in different senses only at Thphr. *Lap.* 61, Orib. *Coll. med.* 8.2.4), whereas γεώδης is very common. So there can be no doubt that it is the *lectio difficilior*. An argument in favour of its authenticity is that in the same chapter A uses the equally rare word ψευδοφανής (see below on §3). The use of the pronoun αὐτῆς first in S rather than τὴν σελήνην as in P can also be explained as a continuation of the reference to the moon in the title (see section C above). S’s text should therefore be preferred, though certainty cannot be attained. See further the discussion in Mansfeld (2000b) 180–181 (= M–R 3.451–453).

§3 Q translates ψυχρομιγὲς ἄμα καὶ γεώδες with *denn sie is leblos und aus kalter und erdarter Substanz gemischt*. *Sie ist leblos* is most likely an addition of the translator, for it is hard to see how it can point to the alternative reading ψυχρομιγὲς in P^B and G.

§4 It is striking that the phrase ἄγκη καὶ νάπας is paralleled exactly at Philo *Somn.* 1.22, even though Philo there is speaking of the heavenly bodies in general. The terminology thus derives from the anterior doxographical tradition. For the first word of the doxa both mss. of S read ἀποσκιάσματα, but since Canter all the editors have adopted his conjecture ἀποσκιάσμα τι (the mss. reading is not even mentioned by Diels at *DG* 361). The reason was presumably because all the other nouns used to explain the appearance were in the singular. But this is hardly compelling. It can be explained by ‘shadow effects’ in the plural. We have retained the mss. reading.

§5 Diels regarded this doxa as a doublet of that of Anaxagoras, and therefore not an authentic report of Parmenides’ doctrine (1897, 110–112). In the first edition of his *VS*, therefore, he placed among the ‘Unechtes’ (B21, p. 129)

and there is has languished ever since (= 28B21 DK). The impression might be given, he notes, that ψευδοφανής is a word from Parmenides' poem (it fits in the hexameter), but that is not the case, because the doxa itself is incoherent. He compares it with the line in 28B14 cited by Plutarch in which the moon is said to have a νυκτιφάεξ and ἀλλότριον φῶς, i.e. a light that shines in the night and is derived from elsewhere (cf. also 28B15 DK; texts cited on ch. 2.28.6). Thus according to Diels ψευδοφανής means the same as ψευδοφαής, to be translated 'mit tauschendem Lichte' and refers to the fact that the moon displays not its own but the sun's (modified) light, as postulated by Anaxagoras. In our view, however, the doxa does belong to Parmenides, and not Anaxagoras. The clue to its interpretation is that this light does not have to be reflected light. It can also appear because the moon's fiery nature is kindled by the sun, as in the Stoic doctrine reported by Cleomedes (see ch. 2.28 Commentary D(d)§3). So the falsity of the moonlight can be due not to the fact that it is not its own light, but to the shadows caused by the dark component, which give it an appearance that is not 'fire-like' but rather earthy (though the term is not used).

§6 The reading ἑτεροειδές in P^B, which deviates from the correct ἀερομυγές in all the other witnesses, is a good example of how corruptions have occurred in the Byzantine mss. Clearly the word became unreadable in the archetype and what we have is simply a scribal guess. The crux in Mau's edition is wholly unjustified and is a clear example of how his edition gives the text of P^B rather than the P tradition (Lachenaud gives the right reading, as did Diels).

§7 This doctrine is not found in this exact form in the extant works of Aristotle, but it is Aristotelian in spirit. At *GA* 3.11 761b21 he states the fire animals should be sought on the moon, since it has a share in the fourth element fire; text below section E(b)§1. On the expression 'fifth body' see our comment at ch. 2.11 Commentary D(d)§5.

e Other Evidence

A distant echo of A's views can be found in the great Arabic scientist ibn al-Haytham (Alhacen) (965–1039), mentioned by Cherniss–Hembold (1957) 19–20; see the text cited below section E(b) General texts. Various opinions are given, including some reminiscent of the doxai in A, e.g. that the facial features are traces of mountains (cf. §§3–4) or reflections of the seas on earth (cf. §2). In addition his own view on the subject recalls the doxa of the scientists in §8, namely that the moon's composition varies from place to place and this affects the transparency of the sun's light that falls on it. Unfortunately Daiber is silent on these parallels in the Arabic tradition and the connection between the doxographical tradition and the author remains a mystery.

Earlier Simplicius in his commentary on Aristotle's mention of the face of the moon in the *De caelo* makes reference to various doxai on the moon's appearance in both Alexander and Iamblichus, including the same theories on reflection or the marks made by earth or sea of mountains. Another doxa on effluences rising from beneath its surface and disturbing its brilliance is not paralleled in A (and also not found in Plutarch).

Finally some more late evidence on this question is found in Philoponus. Huffman (1993) 272 notes that a striking parallel to the first doxa, attributed *inter alios* to Philolaus, is found in his commentary on the reference to the fire-animals on the moon in Aristotle *GA* 761b21. The correspondences are general and not in relation to points of detail. Philoponus asserts that the creatures neither eat nor drink. As Huffman observes, this would mean that they would not produce any excrement either, precisely the detail that A records.

It must be concluded that a great deal of doxographical material on the cause of the face in the moon was built up over the centuries. Some of this has been distilled in A and given elaboration in Plutarch's treatise, but certainly not all of it.

E Further Related Texts

a Proximate Tradition

General texts: Philo *Somn.* 1.145 λέγεται γοῦν, ὅτι σελήνη πύλημα μὲν ἄκρατον αἰθέρος οὐκ ἔστιν, ὡς ἕκαστος τῶν ἄλλων ἀστέρων, κράμα δὲ ἔκ τε αἰθερώδους οὐσίας καὶ ἀερώδους· καὶ τό γε ἐμφαινόμενον αὐτῇ μέλαν, ὃ καλοῦσιν τινες πρόσωπον, οὐδὲν ἄλλο εἶναι ἢ τὸν ἀναμειγμένον ἀέρα, ὃς κατὰ φύσιν μέλας ὢν ἄχρις οὐρανοῦ τείνεται. cf. Lucian see above General texts.

§2 *Others:* Plutarch *Fac.Lun.* 920F–921A (on Clearchus the Peripatetic, not in Wehrli) λέγει γὰρ ἀνὴρ εἰκόνας ἐσοπτρικὰς εἶναι καὶ εἰδῶλα τῆς μεγάλης θαλάσ-

σης ἐμφαινόμενα τῇ σελήνῃ τὸ καλούμενον πρόσωπον. ἢ τε γὰρ ἀκτὶς ἀνακλωμένη πολλαχόθεν ἄπτεσθαι τῶν οὐ κατ' εὐθυωρίαν ὀρωμένων πέφυκεν, ἢ τε πανσέληνος αὐτὴ πάντων ἐσόπτρων ὁμαλότῃ καὶ στιλπνότῃ κάλλιστόν ἐστι καὶ καθαρώτατον. **Lucian** see above General texts.

§§3–4 **Anaxagoras Democritus: Plutarch *Fac.Lun.* 935C** ὥστε μὴδὲν οἰώμεθα πλημμελεῖν γῆν αὐτὴν θέμενοι, τὸ δὲ φαινόμενον τουτοὶ πρόσωπον αὐτῆς, ὥσπερ ἢ παρ' ἡμῖν ἔχει γῆ κόλπους τινὰς μεγάλους, οὕτως ἐκείνην ἀνεπτύχθαι βάθσει μεγάλοις καὶ ῥήξεσιν ὕδωρ ἢ ζοφερὸν ἀέρα περιέχουσιν, ὧν ἐντὸς οὐ καθήσιν οὐδ' ἐπιψαύει τὸ τοῦ ἡλίου φῶς, ἀλλ' ἐκλείπει καὶ διεσπασμένην ἐνταῦθα τὴν σἀνάκλασιν ἀποδίδωσιν (cf. also *Fac.Lun.* 934E–F). **Diogenes Laertius *V.P.* 2.8** (on Anaxagoras, 59A1 DK) τὴν δὲ σελήνην οἰκῆσεις ἔχειν, ἀλλὰ καὶ λόφους καὶ φάραγγας. **Hippolytus *Ref.* 1.8.10** (on Anaxagoras, 59A42 DK) ἔφη δὲ γῆν εἶναι τὴν σελήνην ἔχειν τε ἐν αὐτῇ πεδία καὶ φάραγγας.

§5 **Parmenides:** See on A 2.29.6 and below on §7.

§6 **Stoics: Plutarch *Fac.Lun.* 921F** ἀλλὰ μὴ δόξωμεν ... κομιδῇ προπηλακίζειν τὸν Φαρνάκην, οὕτω τὴν Στωικὴν δόξαν (*SVF* 2.673) ἀπροσάυδητον ὑπερβαίνοντες, εἰπέ δὴ τι πρὸς τὸν ἄνδρα, πα(γέ)ντος ἀέρος μίγμα καὶ μαλακοῦ πυρὸς ὑποτιθέμενον τὴν σελήνην ... see also on A 2.25.5.

§7 **Aristotle: Plutarch *Fac.Lun.* 928F** (on Aristotelian doctrine) ὅλως γάρ, ὦ φίλε Ἀριστότελες, γῆ μὲν οὖσα πάγκαλόν τι χρῆμα καὶ σεμνὸν ἀναφαίνεται καὶ κεκοσμημένον, ὥς δ' ἄστρον ἢ φῶς ἢ τι σῶμα θεῖον καὶ οὐράνιον δέδια μὴ ἄμορφος ἢ καὶ ἀπρεπὴς καὶ καταισχνύουσα τὴν καλὴν ἐπωνυμίαν· εἴ γε τῶν ἐν οὐρανῷ τοσοῦτων τὸ πλῆθος ὄντων μόνῃ φωτὸς ἀλλοτρίου δεομένη περίεσι, κατὰ Παρμενίδην (28B15 DK) 'αἰεὶ παπταίνουσα πρὸς αὐγὰς ἡελίοιο'.

b Sources and Other Parallel Texts

General texts: Aristotle *Cael.* 2.8 290a24–27 ἀλλὰ μὴν ὅτι οὐδὲ κυλιέται τὰ ἄστρα, φανερόν· τὸ μὲν γὰρ κυλιόμενον στρέφεσθαι ἀνάγκη, τῆς δὲ σελήνης αἰεὶ δῆλόν ἐστι τὸ καλούμενον πρόσωπον. **Alexander of Aphrodisias at *Simp. in Cael.* 457.9–30** (on 290a27) ἀλλ' εἰ μὲν τὸ ἐμφαινόμενον πρόσωπον διαφορὰ τις οὐσιώδης ἐστὶ τοῦ σεληνιακοῦ σώματος ἢ παραδειγματικῶς περιέχοντος τὸ πολυειδὲς καὶ διάφορον τῆς γενέσεως, ὥς Ἰάμβλιχός φησιν (fr. 153 Dalsgaard Larsen), ἢ διὰ τὸ μεσότης εἶναι τῶν οὐρανίων καὶ τῶν ὑπὸ σελήνην τὸ μὲν εὐφώτιστον ἔχει, τὸ δὲ σκιερώτερον κατ' οὐσίαν, ὥς ἄλλοις ἀρέσκει, ἰσχυρὸν δοκεῖ πρὸς ἀπόδειξιν τὸ εἰρημένον· πῶς γὰρ τοῦ ὅλου σώματος κυλιόμενου τὴν αὐτὴν ἐκεῖνο θέσιν ἐφύλαττε συνεχὲς ὄν πρὸς τὸ ὅλον; εἰ δέ, ὥς τινες λέγουσιν, ἔμφασις τίς ἐστίν ὥς ἐν κατόπτρῳ ἦτοι τῆς γῆς ἢ τῆς θαλάσσης ἢ τῶν ὀρών, δύναται, φησὶν ὁ Ἀλέξανδρος, καὶ κυλιομένης αὐτῆς ὁμοία μένειν ἢ ἔμφασις τῷ καὶ ταῦτα ἀφ' ὧν ἢ ἔμφασις τὰ αὐτὰ μένειν κἀκείνην πρὸς τὸ δέχεσθαι τὴν τοιαύτην ἔμφασιν κατὰ πάντα αὐτῆς μέρη ὁμοίαν ἔχειν ἐπιτηδεσιότητα καὶ κατὰ τὴν τοῦ σώματος φύσιν καὶ κατὰ τὴν τοῦ σχήματος ὁμοιότητα. ἀλλ' εἰ μὲν ἢ ἔμφασις κατὰ τὴν ἀπὸ τοῦ κατόπτρου τῶν ἀκτίνων ἀνάκλασιν ἐπὶ τὸ ἐμφαινόμενον γίνεται, ὥς τοῖς πολλοῖς δοκεῖ, οὐκ ἂν ἀπὸ παντὸς τόπου ὀρώντι τὸ αὐτὸ ἂν ἐμφαίνοιτο, ὥσπερ νῦν τὸ τῆς σελήνης πρόσωπον καὶ ἀπὸ μεσημβρινωτάτων τόπων καὶ ἀπὸ βορειοτάτων καὶ ἀπὸ

ἀνατολικῶν καὶ δυτικῶν ὁρῶντι τὸ αὐτὸ φαίνεται. εἰ μέντοι ἀπόρροιαί τῶν ὑπὸ σελήνην ἀναθέουσαι ἄλλαι ἀπ' ἄλλων αἰεὶ περὶ τὸ στιλπνὸν τῆς σελήνης τοιαύτην λαμβάνουσι σύστασιν, ὥς καὶ ἐν τοῖς κατόπτοις εἰδῶλῳ ἔμφασιν συνίστασθαι λέγουσί τινες, δυνατόν ἂν εἴη καὶ κυλιομένης καὶ δινομένης τὴν αὐτὴν ἔμφασιν ὁρᾶσθαι ἀπὸ παντὸς τόπου. **ibn al-Haytham (Alhacen)** *Über die Natur der Spuren (Flecken), die man auf der Oberfläche des Mondes sieht* pp. 1–3 Schoy 'Wenn man diese Zeichen der Oberfläche aufmerksam betrachtet und beobachtet, so findet man sie immerfort von derselben Beschaffenheit, und keinerlei Veränderung zeigt sich an ihnen ... Abergläubische und nicht ernst zu nehmende Menschen haben ihre eigene und abweichende Meinung darüber. Gewisse Leute halten dafür, daß die Spuren dem Mondkörper selbst angehören, andere glauben, daß sie sich außerhalb desselben, nämlich zwischen dem Mondkörper und dem Gesicht des Beobachters, befänden, wieder andere glauben, daß sich ihnen ein umgekehrtes Bild darbiete, weil die Mondoberfläche glatt und reflektierend sei ... So gibt es denn auch Leute, die behaupten, daß sie die Figur der irdischen Meere im Spiegelbilde erblicken würden, andere sagen, es seien die Spuren die Bilder der Berge und Gebirge unserer Erde, wieder andere glauben, das Gesehene sei eine Figur, die von den auf die Erde fallenden Reflektionsstrahlen aus ihr ausgeschnitten würde ... Aber alle diese bis jetzt vorgetragenen Meinungen sind unzutreffend und daher wertlos, und wir schicken uns jetzt an, das Irrige all dieser Ansichten darzutun. Danach studieren wir die wahre Natur der Spuren ...' pp. 29–30 'Wir behaupten also, daß der Mond sein Licht von der Sonne empfängt, daß er ohne Transparenzvermögen ist, und daß ihn kein Licht durchdringt. Der lichtabsorbierenden Kraft des Mondes mangelt also die Transparenz. Dafür ist ein deutlicher Fingerzeig in der Tatsache gegeben, daß diese Kraft die Durchdringungskraft für Licht verändert. Und in diesem Hinweis liegt eine Bestätigung für das, was wir schon früher gesagt haben, nämlich, daß die Absorptionskraft die Durchlässigkeit für Licht verändert, welche den durchsichtigen Körpern eignet, daß die Aufnahmefähigkeit des Mondes für Licht eine verschiedene ist, indem einzelne Partien desselben das Licht vollständig aufnehmen, während dies mit anderen—und das sind diejenigen der Spuren—in nur unvollkommenem Grade der Fall ist, und daß dieser Umstand eine Behinderung der Stelle der Spur für eine vollkommene Lichtaufnahmefähigkeit bedeutet.'

Commentary

A *Witnesses*

(1) There are five doxai in S's version of the text, which no doubt he has again written out in full, as he did for the preceding four chapters. None of the doxai raise any suspicion that they may have come from another source such as AD.

(2) P takes over only the first three doxai (the last two in S patently introduce a new subject not covered by the chapter heading). All three are also found in G. For this chapter there are two extra witnesses to P's tradition. A scholion to Ptolemy's *Almagest* writes out all three doxai. The text is found in manuscripts that are considerably older than the Byzantine manuscripts of P; cf. Mansfeld (2000b) 177 with n. 5 (= M–R 3.448–449). Lydus utilizes only the lemma on Eratosthenes.

(3) T refers to the chapter when continuing his scathing report on Greek astronomy. He mentions the subject of distances and then gives a very loose report of the first and third doxai. There is nothing that might indicate extra material not in S or P. More interesting perhaps is an earlier passage at 1.96, in which he notes the faith that people place in the teachings of the astronomers. The passage seems loosely based on 2.31, with particularly the reference to the number 470 myriads of stades a tell-tale sign of dependence. There is no need to speculate that there might be evidence of a chapter on the distance of the earth from the heaven, since the theme could have easily have been suggested by the Empedoclean doxa in this chapter. Given T's loose way of writing in these two passages, there is also no need to conclude that his remarks are based on a different *Vorlage*, *pace* Bottler (2014) 481 (who does not refer to the 1.96 passage). Two texts in the wider tradition, however, do suggest that there may have been chapters on this other theme; see the texts from the Aratea and Isidore of Pelusium in the *Testes secundi* above.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Authors prominent in the proximate tradition seldom refer to views from the early period of Greek philosophy on this subject. In

his vast compendium on natural philosophy Pliny regards attempts to tackle the subject as rather hubristic, but gives a valuable doxography in which the first two views are the same as in A though in reverse order (A's first doxa is attributed to Pythagoras and exact figures are given as well as the ratio). Most intriguingly, all three of A's doxai can be recognized in the same order in Plutarch's treatise *De facie* (discussed at length above on ch. 2.30) (1) Empedocles' view that the moon almost grazes the earth; (2) Aristarchus' view in his treatise that the distance of the sun from the earth is more than 18 and less than 20 times the distance of the moon from the earth; (3) the highest estimate of 4030 myriads of stades, i.e. a very high figure like that in the doxa of Eratosthenes in A (but he is not named by Plutarch). Mansfeld (2000b) 192 = M–R 3.464 argues that Plutarch may have been indebted to the *Placita* literature, but 'that he preferred to substitute more detailed and more accurate data concerning Empedocles and Aristarchus, and replaced Eratosthenes' tenet by an equally spectacular though quite similar view.' For Galen, revealing an attitude opposite to that of Pliny, regards the subject as an example of the extent of the powers of the human mind. Commentators on Plato's astronomy in the *Timaeus*, as witnessed by Hippolytus, Calcidius, and Macrobius (citing Porphyry) also touch on cosmic distances, but they attempt to see a correlation with numbers and ratios based on the construction of the World Soul in 35a–c. A could have used this kind of material but evidently chose not to. See references below in section E(a) General texts.

Ach does not include any material on this subject in his compendium. However, in a brief set of excerpts from introductory material to the poem of Aratus there is a chapter heading *Περὶ ἀποστάσεως τοῦ οὐρανοῦ ἀπὸ τῆς γῆς*. The material in the chapter that follows is not relevant, but the heading itself is of some significance for our analysis. We return to it below.

We have found no direct parallels for the brief diaeresis in §§4–5 on the distance of the earth to the heaven, i.e. the rim of the cosmos, but the subject is briefly raised in comments appended to the discussions of distances in both Pliny *Nat.* 2.87 and Plutarch *Fac.Lun.* 925B–C (texts below section E(a) General texts).

(2) *Sources*. The theme of the chapter is twice briefly mentioned by Aristotle (texts below section E(b) General texts). On both occasions he mentions work done by astronomers, but does not go into detail himself. It is not part of what he considers the subject matter of natural philosophy. Importantly Simplicius informs us that Eudemus discussed the subject of cosmic distances in his account of astronomical researches and made reference to early views (Anaximander, Pythagoreans). This raises the possibility suggested by Mansfeld (2000b) 201 = M–R 3.467–468 that the ultimate source of A's material

might be he rather than Theophrastus as postulated in the Dielsian hypothesis. Posidonius too raises the subject in the context of pointing out the difference between astronomy and physics. But A does not follow this division rigidly in his understanding of the φυσικὸς λόγος, as witnessed in the present chapter with its inclusion of doxai attributed to ‘the followers of the μαθηματικοί and Eratosthenes’. Scientific works with detailed measurements, or at least information from them, were available to later authors such as Plutarch (see below) and Theon of Smyrna.

C Chapter Heading

The heading is of the common umbrella Περί x type. The quaestio is asked in the category of quantity, as is indicated by the use of the word πόσον in P^B’s heading. However, as in ch. 2.30 there is considerable variation in the witnesses for the chapter’s heading. S and P^E have the shortest title without mention of the moon (as in the previous three chapters S places it separately within his longer chapter on the moon, *Ecl.* 1.26). P^B, as in ch. 2.30, has an expanded title. It is not wholly accurate, since in the first and third lemmata the doxai discuss distances of the moon and the sun, not just ‘from the sun’. There can be no doubt that the heading of intermediate length in G and Q is to be preferred. G reads τῆς σελήνης rather than just the bare noun as in all other titles in chs. 2.20–31. It is perhaps to be explained as following on from the earlier use of the article in τῶν ἀποστημάτων, which occurs in all the witnesses. *Pace* M–R 2.2.642, the article should be retained. A more accurate heading would have been Περί τῶν ἀποστημάτων τοῦ ἡλίου καὶ τῆς σελήνης. A similar heading is in fact found in the mss. tradition of G as indicated by Nicolaus’ translation; see Jas (2018a) 217–218. It is consistent with a number of other scattered doxai which deal with both sun and moon together (see our remarks on A 2.28.7). But even this heading in no way covers the final two doxai of the chapter. We return to this problem in our analysis below.

D Analysis

a Context

The final chapter in the sequence of seven chapters on the moon reverts to the category of quantity (made explicit in the long title of P^B), namely the distances of the moon from its adjacent cosmic bodies, the earth and the sun. It is not paralleled in the other chapters on the stars and the sun.

b Number–Order of Lemmata

As in the previous three chapters, it can be assumed that S wrote the chapter out in full. It contains no material that gives rise to suspicion that it might have been added from elsewhere.

c Rationale–Structure of Chapter

The first three doxai focus on the chapter’s subject as indicated in the chapter heading. The first lemma in the reading of the P tradition makes very good sense as the kind of straightforward doxa we might expect from the early period of Greek philosophy: the moon is twice as far from the sun as it is from the earth. The version in S reverses the distances and clearly involves a misreading of A’s original. See further the detailed comment below. The second doxa, increasing the ratio of the distances to 18 times, is unproblematic in both P and S. This is clearly a reference to the view of Aristarchus, who however is not named, in contrast to A 1.15.5 & 9, 2.24.7.

The third doxa, giving the view of Eratosthenes (the only reference to him in Book 2, elsewhere in the surviving *Placita* only at 1.21.3 on time), moves to two specific distances in stades, which have proved a headache for the scribal transmission. The Byzantine mss. again have a case of haplography resulting in only the second figure being preserved. In the remaining witnesses there is a great deal of variation as emerges in the following table:

	First figure	Second figure
Byzantine mss.	missing	78 myriads
E	400 myriads + 8 myriads	78 myriads
S	400 myriad myriads + 8 myriads	78 myriads
G	3 myriads + 8 myriads	78 myriads
Lydus	400 + 8 myriads	78 myriads
Q	408,000	78 thousands
Scholion	300 myriads + 8 myriads	78 myriads
T	more than 400 myriads	none given

The second figure is thus unproblematic, Q obviously having made a mistake (cf. Daiber 1980, 28). In the case of the first number, the variants involving three in G and 300 in the Scholion can be explained. The scholiast’s τ’ (i.e. 300) will be derived from the abbreviation of τετρακοσίας, which in the case of G, as suggested by Jas, the majuscule T’ will have been corrupted to Γ’. The number in S seems excessively high. Diels and Wachsmuth are justified in bracketing the genitive μυριάδων. The most likely number is that in E and L, i.e. 4,080,000. The ratio between the two numbers is closest to 5:1 in round figures. Given the usual methods of the *Placita* one might have expected an ascending sequence. But another option is that A first gave the two whole number ratios, followed by

the figures in real numbers. For further analysis of these numbers see Mansfeld (2000b) 184–188 = M–R 3.456–460, and also section D(d)§3 below.

The final two doxai embark on a different subject, still involving distances but not those of the moon, i.e. the distance from the earth to heaven. Its subject is exactly that of the title of a brief chapter in a small collection of excerpts furnishing introductory material on Aratus' poem (called *Isagoga bis excerpta* by Maass), Περὶ ἀποστάσεως τοῦ οὐρανοῦ ἀπὸ τῆς γῆς. The name-label Empedocles is repeated from the first doxa. In the Presocratic's view the distance from the earth to the heaven is less than the breadth of the heaven, e.g. the cosmos resembles an egg lying on its side. In the final doxa attributed to Boethus, this is a matter of appearance, not reality. We may presume that Boethus espoused the spherical cosmos, which had become standard by his time (on his identity see comment below). Thus these two doxai form a very clear diaeresis, with the 'epistemological' view coming second and last, as more often in the *Placita*. It is very likely that A combined two related subjects that in his source-material had separate chapter headings into a single chapter.

d Further Comments

Individual Points

§1 The genitive τῆς σελήνης in S can be explained if one understands τὸ ἀπό-στημα from the chapter heading. Mansfeld (2000b) 185 puts forward another explanation: 'the genitive ... is an obvious mistake ... Stobaeus decided to delete τῆς σελήνης in his sub-heading, and this decision was still on his mind when he copied out the first lemma so he wrote a genitive instead of the required accusative'. However this may be, the reading τὴν σελήνην uniformly found in the tradition of P is certainly to be preferred.

§3 The reading ὀκτακισμυρίας (fem. plur.) might seem to be dubious Greek, since ὀκτακισμύριος is an adjective and here it does not appear to qualify a noun. We assume that it has been formed through attraction to τετρακοσίας. The reading in S, στάδια ὀκτάκις μύρια, can be read as a somewhat clumsy attempt to remedy the solecism, involving the repetition σταδίων ... στάδια.

For an analysis of the distances attributed to Eratosthenes see Carman–Evans (2015) 7–11. They argue that (1) it is plausible that Eratosthenes dealt with the subject of the distances of the sun and moon from the earth in the context of his work *On the Measurement of the Earth*, and that (2) 'all ambiguity' in relation to which number to read for the distance of the sun from the earth 'can be removed, for only the solar distance of 4,080,000 stades is consistent with Eratosthenes' second value for the size of the earth.' They then conclude (p. 16) 'we can now understand why Eratosthenes treated the distances of the Sun and Moon in a work supposedly devoted to the measurement of the Earth.'

The distances of the Sun and Moon are entangled, for example, in Aristarchus' method and must be found together. And the distance of the Sun is required for Eratosthenes' calculation of the upper limit for the size of the Earth.' If these scholars are correct in their assumptions and conclusions, therefore, there is a good chance that the numbers attributed to Eratosthenes in A are correct.

§4 One would expect on the basis of this information that the 'egg-like' cosmos lying on its side would do so lying horizontally and not standing vertically. The verb κείσθαι certainly suggests the former. Couprie (2020) argues, however, that a visualisation of Empedocles' cosmology requires the latter and that this is compatible with the present doxa (though only just). It is certainly true that a standing egg is more likely to tip to one side than a lying one. Strictly speaking, of course, the cosmos will be 'ovoid' in shape, i.e. symmetrical (unlike an egg). But since the comparison here is explicitly with an egg, we translate the term ὠοειδής used at A 2.2.3 with 'egg-like' similarly to other -ειδής terms.

§5 Boethus of Sidon, a second cent. BCE Stoic, wrote a Commentary on Aratus' poem, which is cited by the *Isagoga bis Excerpta* 5 = 324.8–9 Maass (on the work and this reference see Goulet at *DPhA* 2.124). According to Von Arnim *RE* 3.602, it is likely, but not certain that the doxographical material attributed to him was derived from this work. Boethus the Peripatetic, also from Sidon, is dated to the end of the first cent. BCE, so is very likely too late for the *Placita* (though he is contemporary with Xenarchus, the latest philosopher to be cited). Boethus is only cited here in Book 2, but elsewhere also at A 1.7.16 and 3.2.7.

Commentary

A *Witnesses*

The final chapter of Book 2 leaves the subject of the moon and returns to the heavenly bodies as a group (cf. ch. 2.13–19). After the (for us) pleasant interlude of ch. 2.28–31, when S writes out A's chapters in full, we must return to our usual practice of commencing with the tradition of P.

(1) The Byzantine mss. preserve seven doxai (if name-labels separated by μέν ... δέ are separately counted). E omits the final anonymous doxa, but it is retained in G and Q (G's text is damaged towards the end, but the word ἐπτά indicates that his text originally contained it). Psellus adapts the title heading. His list of the length of the planetary revolutions is parallel to what is found in P, but not dependent on it for any of the details.

(2) S makes use of this chapter in his source in a quite different place than the other chapters on the heavenly bodies, namely in the early ch. 8 Περί χρόνου οὐσίας καὶ μερῶν καὶ πόσων εἴη αἴτιος. In this chapter, after various poetical quotes and apophthegmata, he quotes material from chs. 1.21–22 and 3.8, interspersed with copious excerpts from AD. He then appears to write out the contents of ch. 2.32 almost in full, just like later he was to do with chs. 2.28–31. Certainly all the material in the tradition of P can be located in his extract except the final anonymous doxa. His evidence also reveals three additional doxai and some expanded name-labels. The order of the material in both P and

S is the same, which encourages the conclusion that in S we have the chapter complete except the final doxa.

(3) There is again no trace of this chapter in T.

B Proximate Tradition and Sources

(1) *Proximate tradition.* Cicero calls the theme of the Great year a *magna quaestio* at ND 2.51 and goes on to list the lengths of the revolutions of the planets, but he does not provide any doxographical information for either subject (apparently he expanded on it the question of the great year in his lost *Hortensius*; a text in Servius records the numbers 12,454 and 12,954). Material parallel to A is found compactly presented in Ach (in the second of the two pages cited above), but above all in a most extensive account in the third century Roman writer Censorinus, a crucial passage which gives us a unique insight into some of the riches of the doxographical tradition that have not come down to us. We study these texts in more detail below in section D(e) and cited them in section E(a).

(2) *Sources.* There is a good deal of evidence to show that early Greek philosophers and scientists, no doubt borrowing from Babylonian predecessors, were not only acquainted with the length of the planetary years (which was uncontroversial and recorded in numerous texts), but were also preoccupied with the length of two more complex years, the luni-solar year and the so-called 'Great year' encompassing the revolutions of all seven planets. The earliest evidence relates to Heraclitus in our chapter and has been linked to his interest in the regularity of natural processes, e.g. in a Great winter and a great Summer presumably related to the Flood and the Fire, on which see below; cf. Marcovich (2001a) 347–349. The evidence of Oenopides and Philolaus points to the calculation of the luni-solar year, on which see Huffman (1993) 277–279. Democritus wrote a treatise entitled 'Great year', also called 'Astronomy' (D.L. 9.48), from which we may deduce that he discussed a Great year as part of his treatment of astronomy. Plato famously mentions the Great year at *Tim.* 39d, calling it the 'perfect year' but giving no indication of its length.

Both ancient sources and modern scholars have frequently linked the question of the great year to various other themes, e.g. the reincarnation of the soul (Empedocles), periodic natural disasters (cf. Aristotle's comment at *Mete.* 1.14), the periodic conflagration of the universe (esp. the Stoa), the theory of eternal cyclical return (mentioned by Origen *Cels.* 5.20–21 in relation to the Christian doctrine of ἀποκατάστασις), and so on. None of these related themes are explicitly mentioned in A's chapter (and we shall not discuss them in any further detail). He confines himself to the astronomical facts (and speculations).

Many ancient texts combine information about the length of the planetary revolutions and the much longer period of the Great year, a practice that goes back at least to Plato *Tim.* 39c–d. In addition, numerous texts record a diversity of computations for the Great year. For very full lists see Adam's note on *Resp.* 546b (1902, 2.302–305), Pease's note on Cic. *ND* 2.52, Rocca-Serra (1980) 61–64, Sallmann (1983) 39–44. We cite a generous selection of these texts below.

C Chapter Heading

P^B has a lengthy chapter heading consisting of three parts, which must have also been present in Q's exemplar. E and G just take over the first part, using the umbrella formula Περὶ x, with P^B and E having the singular ἐνιαυτοῦ (Mras emends) and G and Q the plural ἐνιαυτῶν. Both are possible (S cannot help us, for he preserves only the single adapted word πόσων in his composite title for *Ecl.* 1.8). The early witness E tips the balance. But should the longer heading in P^B be retained? It could have been deduced from the contents of the chapter. But it is possible that the word πόσων in S's chapter heading is a pointer to the heading that he had before him (cf. P^BQ πόσος). It is thus justified to retain the longer heading. As in the previous chapter the term πόσος indicates that the question is in the category of quantity.

D Analysis

a Context

The chapter returns to a treatment of all the planets, which had earlier been discussed in chs. 2.13–19. Since time, or at least its measurement, was commonly regarded as resulting from planetary movement (cf. various doxai in chs. 1.21–22 and Plato's classic treatment in the *Timaeus*, where the genesis of time is described in 38b–39e after the creation of the heavenly bodies in 36d–38b), and since moreover the yearly revolution of the sun and the monthly revolution of the moon play a key role in the measurement of time, it was logical to place the discussion of cosmic time after the treatment of these two bodies. In addition, the subject of the Great year involves the combined movement of all the planets, so forms a fitting climax for the treatment of cosmology in Book 2.

b Number–Order of Lemmata

As argued above, the chapter is most likely complete if the final lemma in P is added to the sequence of doxai in S. There is also no conflict between the two witnesses on the order of the doxai. It is possible that the introductory lemma on the Great year (S₂), which is missing in P, was added from elsewhere. This is argued by Bottler (2014) 488, who notes the interposition of *oratio obliqua*

in between two passages of *oratio recta* and the repetition of the term ὁ μέγας ἐνιαυτός in §2 and §3. She argues that it derives from another source such as AD or another place in A. However, without it the concept of the Great year is not explained. The philological argument is far from compelling. Changes between *oratio recta* and *oratio obliqua* and vice-versa are common in the *Placita*. A good parallel is located at A 2.12.2, where the doxa with name-labels is in *oratio obliqua* and the explanation of the heavenly circles in *oratio recta*. In fact, in the present chapter the first two doxai, as we shall soon see, are best seen as nominal definitions. The lemma must be retained in our reconstruction.

c Rationale–Structure of Chapter

The chapter opens with a straightforward listing of the planetary ‘years’, which are taken to be the time of their revolution around the earth in the geocentric standard model of ancient astronomy. It is presented in the indicative without any name-labels. This is best taken as a nominal definition, i.e. preliminary to the discussion. But in this case there is no discussion because the contents were universally acknowledged and there are no alternative views (*pace* G, who gives 15 months for Mars). The numbers are presented in round figures (30 years, 12 years, 2 years, 12 months, 30 days) with symmetrical neatness very typical of our author. A month for the moon is taken to be equivalent to a year for the sun, i.e. a complete revolution.

The remainder of the chapter treats the ‘Great year’. It is first explained in a second nominal definition (though this time in *oratio obliqua*). It too is generally accepted, but it will emerge that it is in fact deficient because it fails to distinguish sufficiently clearly between two kinds of ‘Great year’: (a) the shorter luni-solar year which measures the perfect conjunction between solar and lunar cycles (§§3–6); and (b) the much longer ‘Great year’ which calculates the conjunction between the revolutions of all seven planets (§§7–10). In contrast to Censorinus (see below section D(e)), who distinguishes between an *annus magnus* and an *annus maximus*, A uses the term μέγας ἐνιαυτός for both. It might be argued, however, that the obscure statement in §7 is meant to mark the transition between the two kinds. of year.

The doxai in the first group refer to the luni-solar year and give the lengths of 8, 19, 76 and 59 years. For only the last doxa does A give name-labels, i.e. Oenopides and Pythagoras (only in S); on these see detailed comments below. The order is basically ascending in magnitude. 76 precedes 59 perhaps because of the neatness of it being exact four times the length of the preceding doxa, or because the last doxa is the only one with name-labels (although, as Ach and Censorinus show, these were readily available).

The next doxa (§7) is quite puzzling. Formally it seems to just continue the list of anonymous doxai, but its contents make clear that it actually introduces the final group of four doxai (§§7–10) which give views on the length of the ‘Greatest year’, i.e. the length of time it takes for all seven planets to line up in single plane. The expression ‘in the head of Kronos’ is highly obscure; see our further comment below. No figure is given in this doxa, but it is followed by three doxai with very large figures, the first two with name-labels, the final one anonymous. Here too the order is basically ascending, but the final number is less than the previous two.

The structure of the chapter can thus be summarized as follows. Its first part gives the length of planetary ‘years’ without any differences of opinion. Its second part divides into two. First various views on the length of the smaller ‘Great year’, i.e. the luni-solar year, are given. Secondly some opinions on the length of the ‘Great year proper’ are presented. The sequence of figures is basically ascending in length, but in both groups there is an exception. We shall see below in section D(e) that this manner of presenting figures in an ascending sequence is a standard doxographical technique. Both parts commence with a nominal definition.

d Further Comments

Individual Points

§1 There will have been numerous accounts of the length of the planetary years in all manner of handbooks. Below we cite passages from Cicero (drawing on such material), Geminus, Cleomedes and Theon of Smyrna. A uses the mythological names only, namely (apart from the sun and moon) Kronos, Zeus, Ares, Hermes and Aphrodite. These he had already introduced in ch. 2.15. The handbook accounts use both the mythological and the phenomenological names; see further our comments on A 2.15.4–5.

A’s use of the μέν ... δέ construction in §1 is difficult to reconstruct. P^B has Κρόνου μέν and Διὸς δέ, but P^G and S delete the δέ. It is best to retain it because otherwise the μέν remains without a pendant. The reading in G of ἐνιαυτός μέν ἐστὶ is attractive, because it suggests a pendant in the next doxa γίνεσθαι δέ ...

§6 The two name-labels are presented in a non-chronological order, Oenopides being generally dated to the fifth cent. BCE. The unexpected order can be taken to mean that this length of the Great year is above all associated with Oenopides (fifth cent. BCE), but that in fact he took the measurement from Pythagoras. One recalls A 2.12.2, where he is said to have plagiarized Pythagoras’ discovery of the Zodiac circle. See further Burkert (1972) 306, Bodnár (2008) 9–10. Censorinus, however, mentions only Philolaus.

§7 The manuscript reading Κρόνου is unlikely to be correct. There is most likely a link with Plato's description of the periods of time of the heavenly bodies at *Tim.* 39c–d, where κεφαλή may mean 'starting-point', as translated by Cicero, i.e. the aligned position of the planets as indicated by the place of Saturn. So we have overcome our hesitation in M–R 2.653 and now agree with Taylor (1928) 220 that it should be emended. The proposed emendation χρόνου is taken over (without acknowledgement) by Bodnár (2008) 26 (but the translation 'consummation of time' is less persuasive). The further expression 'return of the movement from the North' (τῆς ἐξ ἄρκτου φορᾶς ἐπάνοδος) in the mss. is altogether too obscure and Taylor's emendation ἐξ ἀρχῆς should be accepted.

§8 For various considerations that make it probable that Heraclitus' original number was 10,800, including the evidence of Censorinus, see the commentary of Marcovich (2001a) 347. But the mistake could have occurred already in the doxographical tradition. Mindful that we reconstructing A and not Heraclitus, however, we retain the mss. reading.

§10 For the number 7777, for which there is no close equivalent in Censorinus, one might compare the number 9977 in Sextus Empiricus (text below section E(a) §§7–10).

e Other Evidence

As noted above in section B, two passages in Ach cover similar ground to our chapter. The title of his ch. 18, Τίς ὁ καλούμενος μέγας ἐνιαυτός, καὶ ἐν πόσοις χρόνοις ἕκαστος τῶν πλανήτων ἀποκαθίσταται, is not dissimilar to that in P, with the two parts reversed. More detail is given than in A, but the figures for the solar revolutions are the same. The figure that he gives for the Great year of Saturn, 350,635 years, does not correspond with any figure in A (he also gives a figure for a 'Great year' of Jupiter, 170,620 years). In the following ch. 19 on the sun there is also a relevant section on its revolutions. Three views are given on the length of the luni-solar year, of which two are found in A (8, 76, 19 years). Differently from A, however, Ach supplies name-labels (Eudoxus, Callippus, Meton, followed by Aratus). Of these names the first and last appear in A at 2.19.3.

But by far the most interesting text for comparison with A is the massive doxographical account given by the third cent. rhetor Censorinus when congratulating his patron Caerilius on his 49th birthday in 238 CE. As noted above, in his account Censorinus makes a clear distinction between an *annus magnus*, i.e. 'solar year' (18.2), and an *annus maximus*, which is not only associated with the return of all the planetary bodies to the same point, but also with the life-cycle of the entire universe (18.11). We cite the complete text below in section E(a) §§2–10. In relation to A's chapter it can be summarized as follows (corresponding doxai in A are indicated in square brackets):

Doxa	Name-label	
18.2	annus magnus (cf. 18.11)	
18.2	διετηρίς/τριετηρίς (2–3)	ancient Greeks
18.3	τετραετηρίς/πενταετηρίς (4–5)	ancient Greeks
18.5	ὀκταετηρίς/ἐννεατηρίς (8) [2.32.3]	some say Eudoxus of Cnidus others Cleostratus of Tenedos then Harpalus, Nauteles, Menestratus others Dositheus
18.7	δωδεκαετηρίς (12)	Chaldeans
18.8	ἐννεαδωδεκαετηρίς (19) [2.32.4]	Meton
	59 years [2.32.6]	Philolaus the Pythagorean
	76 years [2.32.5]	Calippus of Cyzicus
	82 years	Democritus
18.9	204 years	Hipparchus
18.10	1461 years	Egyptian calendar
18.11	annus maximus	(Aristotle)
	2484 years	Aristarchus
	5552 years	Aretes of Dyrrachium
	10,800 [cf. 2.32.8]	Heraclitus and Linus
	10,884	Dion
	120,000	Orpheus
	3,600,000	Cassander
	infinite	others

Although the doxography is much fuller and more detailed, the structure is very similar to that of A. There is a long list of numbers ascending (more consistently than in A) from small to very large, with a main division made between the two types of Great year (only implicit in A). The parallels for the various 'luni-solar' years are striking. Like Ach Censorinus gives name-labels. A for whatever reason left most of them out. The only name-label held in common is Heraclitus. The confusion between the two figures 18,000 and 10,800 could easily occur. Both may well have a Babylonian origin, 5×3600 and 3×3600 , 3600 being a Babylonian sar; cf. Van der Waerden (1952) 142.

Diels in *DG* 186–199 devoted much attention to Censorinus' book in relation to significant doxographical parallels to A's books 4 and 5. But oddly he does not touch on this chapter. As Rocca-Serra (1980) ix notes, it is very likely that the material ultimately derives from the *Placita* tradition. The intermediary is

most likely to have been Varro, as elsewhere in Censorinus. A strong hint in this direction is given by the name Dion (of Naples), who elsewhere is only mentioned by Augustine *C.D.* 21.8 in a verbatim quote from Varro *De gente populi Romani* (Sallmann 1988, 129). A, Ach and Censorinus are drawing on a common fund of material going back at least to the early first cent. BCE or earlier, and in the case of A and Censorinus, using a similar method to organize and structure it.

§§2–10 **Great year.** Censorinus DN 18.1–15, pp. 39.17–45.12 Sallmann ... nunc de annis maioribus dicam, quorum magnitudo adeo diverse tam gentibus observata quam auctoribus tradita est, ut alii annum magnum esse in annis vertentibus duobus, alii in multis milibus annorum arbitrati sint. quod quale sit, iam hinc conabor absolvere. (2) veteres in Graecia civitates cum animadverterent, dum sol annuo cursu orbem suum circumit, lunam novam interdum <duodecies, interdum> tridecies exoriri idque saepe alternis fieri, arbitrati sunt lunares duodecim menses et dimidiatum ad annum naturalem convenire. itaque annos civiles sic statuerunt, ut intercalando facerent alternos duodecim mensum, alternos tredecim, utrumque annum separatim vertentem, iunctos ambo annum magnum vocantes. idque tempus τριετηρίδα appellabant, quod tertio quoque anno intercalabatur, quamvis biennii circuitus et re vera διετηρίς esset; unde

mysteria, quae Libero alternis fiunt annis, trieterica a poetis dicuntur. (3) postea cognito errore hoc tempus duplicarunt et τετραετηρίδα fecerunt. sed eam, quod quinto quoque anno redibat, πενταετηρίδα nominabant, qui annus magnus ex quadriennio commodior visus est, (cum cognitum esset) solis annum constare ex diebus CCCLXV et diei parte circiter quarta, quae I in quadriennium diem conficeret. (4) quare agon et in Elide Jovi Olympio et Romae Capitolino quinto quoque anno redeunte celebratur. hoc quoque tempus, quod ad solis modo cursum nec ad lunae congruere videbatur, duplicatum est et ὀκταετηρίς facta, quae tunc ἑννεατηρίς vocitata, quia primus eius annus nono quoque anno redibat. (5) hunc circuitum vere annum magnum esse pleraque Graecia existimavit, quod ex annis vertentibus solidis (et mensibus solidis) constaret, ut proprie in anno magno fieri par est. nam dies sunt soli (di IDCCCCXXII, menses solidi) uno minus centum, annique vertentes solidi octo. Hanc ὀκταετηρίδα vulgo creditum est ab Eudoxo Cnidio institutam, sed alii Cleostratum Tenedium (6B4 DK) primum ferunt conposuisse et postea alios aliter, qui mensibus varie intercalandis suas ὀκταετηρίδας protulerunt, ut fecit Harpalus, Nauteles, Menestratus, item alii, in quis Dositheus, cuius maxime ὀκταετηρίς Eudoxi inscribitur (fr. 131 Lasserre). (6) ob hoc in Graecia multae religiones hoc intervallo temporis summa caerimonia coluntur. Delphis quoque ludi, qui vocantur Pythia, post annum octavum olim conficiebantur. proxima est hanc magnitudinem quae vocatur δωδεκαετηρίς ex annis vertentibus duodecim. (7) huic anno Chaldaico nomen est, quem genethliaci non ad solis lunaeque cursus, sed ad observationes alias habent adcommodatam, quod in eo dicunt tempestates frugumque proventus ac sterilitates, item morbos salubritatesque circumire. (8) praeterea sunt anni magni conplures, ut Metonicus, quem Meton Atheniensis ex annis undeviginti constituit, eoque ἑννεαδεκαετηρίς appellatur et intercalatur septies, inque eo anno sunt dierum VIDCCCCXL. est et Philolai (44A22 DK) Pythagorici annus ex annis quinquaginta novem, in quo sunt menses intercalares viginti et unus; item Callippi Cyziceni ex annis septuaginta sex, ita ut menses duodetriginta intercalentur; et Democriti (fr. 423 Luria) ex annis LXXXII cum intercalaris perinde viginti octo; sed et Hipparchi ex annis CCCIII, in quo intercaletur centies decies bis. (9) haec annorum magnitudo eo discrepat, quod inter astrologos non convenit, quanto vel sol plus quam CCCLXV dies in anno conficiat, vel luna minus quam triginta in mense. (10) ad Aegyptiorum vero annum magnum luna non pertinet, quem Graeci κυνικόν, Latine canicularem vocamus, propterea quod initium illius sumitur, cum primo die eius mensis, quem vocant Aegyptii Θωυθί, caniculae sidus exoritur. nam eorum annus civilis solidus habet dies CCCLXV sine ullo intercalari. itaque quadriennium apud eos uno circiter die minus est, quam naturale quadriennium, eoque fit ut anno MCCCCLXI ad idem revolvatur principium. hic annus etiam ἡλιακός a quibusdam dicitur, et ab aliis θεοῦ ἑνιαυτός. (11) est praeterea annus, quem Aristoteles (Protr. fr. 19 Ross) maximum potius, quam magnum appellat, quem solis et lunae vagarumque quinque stellarum orbis conficiunt, cum ad idem signum, ubi quondam simul fuerunt, una referuntur. cuius anni hiemps summa est κατακλυσμός, quam nostri diluvionem vocant, aes-

*tas autem ἐκπύρωσις, quod est mundi incendium: nam his alternis temporibus mundus tum exignescere tum exauescere videtur. hunc Aristarchus putavit esse annorum vertentium $\overline{\text{IICCCCLXXXIII}}$, Aretes Dyrrachinus $\overline{\text{VDLII}}$, Herac- litus et Linus $\overline{\text{XDCCC}}$, Dion $\overline{\text{XDCCCLXXXIII}}$, Orpheus $\overline{\text{CXX}}$, Cassandrus tricies sexies centum milium; alii vero infinitum esse nec umquam in se reverti existi- marunt ... Aetius Placita
Book 3 Meteorology and the Earth:
Text and Commentary

Introduction to Book 3

1 Transmission

Book 3 of A's compendium is not very well attested. In its present condition it is by far the shortest in terms of chapters (18), doxai (109) and absolute length (2811 words), and like Book 5 it is quite incomplete.¹ P^B and P^Q are available for all of its eighteen chapters, and E copied out P 3.9–11, the heading of P 3.12 but with the text of P 3.13, and P 3.16, so five chapters in all. G excerpted P 3.1–5, 3.7–11, and 3.13–16, thus omitting P's chs. 6, 12 and 18, but still preserves a lot of P's Book 3 (about 60%) and so provides valuable evidence to complement P^B and P^Q for relatively large sections of the book. In addition there are four very small scraps from the Antinoopolis papyrus, while some headings and lemmata are confirmed by Psellus. Due to Byzantine abridgement S, omitting all of chs. 3.9–14, 3.16 and 3.18, is only available for sections of chs. 3.1–8, 3.15 (where only the Plato doxa remains out of 11 lemmata preserved in P), and 3.17. S therefore unusually provides only 60 doxai to P's 91. Similarly to Books 1 and 4, therefore, one can make a division between the part for which S is available and the part where there is only P. T leaves aside this book entirely. In addition, chs. 3.9–14 on the earth, where only P and his tradition are available, have clearly been drastically epitomized. The number and order of the lemmata of these chapters must remain fixed as we find them there. At most we can speculate on how P might have epitomized the material he found in A, in some cases comparing material found in proximate and other sources or extrapolating from what we know about P's methods elsewhere in his *Epitome* (for example his manipulation of name-labels). In those cases we shall speak primarily about P, though it must always be borne in mind that A will be hovering in the background.

2 Subject Matter and Macrostructure

There is a division of subject matter between Books 2 and 3, which at first glance seems quite strict. Moreover the Book itself consists of two different parts.

The prooemium of our Book states that in the preceding Book the 'things in the heavens' (*ta ourania*) have been treated, and that it is now the turn of 'what is in the atmosphere' (*ta metarsia*) 'in the third (Book)'. By mentioning

¹ For the statistics in this section see further Appendix 3 to the General Introduction.

both the *ourania* and *metarsia*, it emphasizes the unity of the work. Ch. 3.1 on the Milky Way has a transitional function, as the first and highest of the *metarsia* so closest to the *ourania*, see ch. 3.1 Commentary D(a). The procemium also draws attention to the unity of the book because it not only mentions the *metarsia* but also the ‘position of the earth’, i.e. refers to ch. 3.11 and its immediate context. In the introductory passage at ch. 3.8.2 below both these parts are mentioned again, the one as having been treated, the other as to be treated now. Here we should note that ch. 3.18 ‘On the halo’, at the end of Book 3 in P (a chapter not paralleled in S), is in the wrong place, as Diels already saw. It belongs with the *metarsia*, not with the *prosgeia*. We have therefore decided to put it back to where it belongs, that is after ch. 3.5 ‘On the rainbow’, and to give it the new number ‘3.5a *olim* 18’. After all, we are reconstructing A, not editing P. An unintended benefit of this rearrangement is that we get two successive series of exactly nine chapters each, with first the *metarsia* and then the *prosgeia*, which, as a neat division of the Book’s overarching themes, is a good result. So Book 3 as reconstructed neatly splits into two equal halves.

Even so, it has to be admitted that P 3.18 could have been shifted to the end of the Book to strengthen the impression, by returning after the *prosgeia* to the *metarsia* with which it begins, that it is a unity. And there are other considerations in favour of leaving P 3.18 in its present anomalous position. In Aristotle the phenomena of reflection (rainbows, halos, mock suns) are found at the end, in *Meteorology* Book 3. In A these phenomena, except the chapter on the halo, have been moved forward in order to be included among the meteorological phenomena and so make room for the terrestrial phenomena. One could argue that the chapter on the halo was forgotten and remained stuck in its original final position. A further possibility is that originally it was omitted and subsequently reinserted where room was available, namely, at the end of a scroll. It is in our view more likely, however, that it has been misplaced, and for this reason we have moved it to after ch. 3.5 in our reconstruction.

A subsidiary argument in favour of this decision is that the division between Books 3 and 4 is less clear-cut than that between Books 2 and 3. The two chapters dealing with the sea at 3.16–17 are followed beyond the Book division by the remaining chapter on terrestrial waters, ch. 4.1 on the Nile. In its final position, as occurs in P, the chapter on the halo gets in the way, and as we have seen at ch. 3.5a Commentary A and D(a) it is not found in G, whose abridged version of 4.1 follows on directly after that of 3.17. Moreover both ch. 3.17 and ch. 4.1, as we shall see below, present *recherché* name-labels not or very rarely found elsewhere in the *Placita*.

An important contrast resulting in a further subdivision in the first part of the Book (chs. 3.1–8) is between meteorological phenomena that are real (καθ’

ὑπόστασιν) and those that are merely optical (κατ' ἔμφασιν). This is only made explicit quite a long time after the prooemium, viz. at the beginning of ch. 3.5 'On the rainbow'. The postponement of the expression of this preliminary consideration (which puzzled Diels) faithfully echoes the procedure of Aristotle's *Meteorology*, where this is made an important thematic issue as late as, and only in, Book 3, in which the rainbow and similar phenomena are treated. There is no need to link this contrast with the name of Posidonius, as used to be the *opinio communis*; thus e.g. Strohm (1953) 286: 'Die kluge Einteilung ... in Vorgänge, die der Substanz nach, und solche, die nur nach dem optischen Eindruck existieren (κατ' ἔμφασιν/καθ' ὑπόστασιν), gilt seit langem mit Recht als eine Art Leitfossil für Poseidonios.'

On the divisions and unity of the treatise see also above, General Introduction section 2.7.

A is bent on following an order which goes from the periphery to the centre not only in the treatise as a whole (see M–R 2.1.40–41, 50–59 and *passim*), but also in the present Book: atmospheric phenomena from Milky Way via comets (ch. 3.2), thunder and lightning (ch. 3.3), clouds (ch. 3.4), rainbow (ch. 3.5), rods (ch. 3.6), winds (ch. 3.7), and summer and winter (ch. 3.8) to a cluster of chapters dealing with the earth and the sea. (P 3.18, on the halo, as we have seen is actually in the wrong place.)

Because of this arrangement all the issues concerned with the earth, even those regarding its position and behaviour as a cosmic body, are treated in Book 3 after those in the atmosphere. In Aristotle's *On the Heavens* the earth (*Cael.* 2.13) is part of the cosmic system, like the sun and the moon. It looks like Aristotle included this discussion mainly because of the theory of the Pythagoreans. In A the themes of Aristotle's chapter and related issues have been interpolated in the meteorology, between the chapters on winds and on summer and winter on the one hand and that on earthquakes on the other, both winds and earthquakes having been treated at length in the *Meteorology*. The macro-structure of Book 3 is thus the outcome of a rearrangement of the Aristotelian template, or templates. That this did not have to be the case is clear from Seneca's different approach in the *Naturales quaestiones* (see for example *Nat.* 2.1.4–5) and other parallels. Seneca's treatise begins the other way round, namely with phenomena that are close to the centre, that is, with the terrestrial waters of the present Book 3 according to a later reordering, but Book 1 according to Seneca's own and original order. See further M–R 2.1.110–125.

It should be noted, finally, that—unlike in most other books, but like chs. 1.9–30—all the chapters without exception begin with the umbrella heading περὶ τοῦ δεῖναι, for which see above, ch. 1.3, Commentary C.

3 Name Labels

In several respects this Book is rather different from the others. The name-labels of chs. 1–15 are of philosophers only, but ch. 16 includes the Sophist Antiphon who dabbled in natural philosophy, and in ch. 17 on the tides we encounter no less than five non-philosophers: Pytheas, Timaeus, Crates, Apollodorus (unknown), and Seleucus (a comparable bevy of non-philosophers is found only in ch. 4.1, likewise treating a subject not dealt with by Aristotle). As to schools, apart from Stoics we only have Peripatetics at ch. 3.2.6. Anonymi are limited to just five examples. This incidence of name-label and diversity differs markedly from the other four books. The following name-labels are represented with an unusually high number of doxai: Metrodorus (9 doxai, i.e. top of the list!), Anaxagoras (8 doxai), Anaximenes (6 doxai), Anaximander (4 doxai), Heraclides (3 out of 9 doxai in the whole treatise), while Plato (2 doxai), Empedocles (3 doxai), Pythagoras (1 doxa), and Heraclitus (1 doxa) are unusually low. Atomists are cited separately, not lumped together as occurs so often elsewhere. The number of multiple name-labels is the lowest of all the Books, also relative to its size, namely 8, all just consisting of 2 name-labels. Not surprisingly, therefore, in terms of name-labels, Book 3 has least overlap with other Books.

4 Successions and Historical Presentation

Book 3 is the most historical of all the Books in terms of the chronological ordering of sequences of name-labels. It also appears to be the least dialectical, so contrasts strongly with Book 2, where these two positions are reversed. Successions play a minor role, but we still find Thales first in chs. 3.9–11 and 15 (including ‘the successors of Thales’ in 3.11), and Pythagoras or Pythagoreans first in chs. 3.1, 3.2 and 3.14. For the present sections 3 and 4 see further the statistics of Jeremiah (2018) at M–R 4.301, 314–316, 321, 324, and 335.

5 Sources: Proximate Tradition

For the proximate tradition of A’s material in this Book there are substantial parallels to be found in a number of texts, though such evidence is poor or virtually absent for chs. 3.8–9 and 3.12. Among these the most prominent are Lucretius *De rerum natura* Books 5–6, Seneca *Naturales quaestiones*; then Strabo, Manilius, ps.Aristotle *De mundo*, Pliny *Naturalis historia* Book 2, the physical fragments of Arrian, Diogenes Laertius, Hippolytus *Refutatio omnium*

haeresium Book 1, Macrobius in *Somnium Ciceronis*, and Achilles *De universo* (see below) as well as the *Scholia* on Aratus. For the Lucretian texts the great Léon Robin, in the Ernout–Robin commentary of 1925–1928, already appealed successfully to the doxographical context of the arguments on meteorology and psychology. The sequences of meteorological themes in Lucretius parallel to A Book 3 are listed in Runia (1997) 96–97, repr. M–R 3.260–261. Sedley (1998b) 157–160 puts the closely parallel themes of *DRN* book 6 and A Book 3.1–4.1 [note misprint: 4.7], plus the less complete evidence of *Metarsiology* (for which see the next section) in parallel columns. Dependence of Lucretius for this material on Epicurus cannot be proved, but according to Sedley is plausible in view of Lucretius’ dependence on Epicurus’ *On Nature* which, as he posits, can be demonstrated for the rest of the *DRN*. Epicurus, in his turn, would depend on Theophrastus, with a key role for the *Physikai Doxai* (*ibid.* 166–185). Obviously, Sedley’s interesting and at a first glance seductive source-critical hypothesis cannot be discussed here. But it is worth repeating that the similarities in macro-organisation between Lucretius and A on meteorology cannot be a matter of coincidence, see Runia at M–R 4.409–411. For the situation in Book 4 on psychology see below Book 4, Introduction, section 6, Parallels in Lucretius and Tertullian. Detailed discussions, overviews, and lists in parallel columns of meteorological phenomena in a multiplicity of related sources are found in Bakker (2016) 76–161, ch. 3 ‘Range and order of subjects in ancient meteorology’. For literature on sources and predecessors of Seneca in the *Naturales quaestiones* see Hine (2009–2010) 2.38–50.

In Achilles *De universo* three meteorological chapters have been inserted near the end: Ach. c. 32 ‘On things in heaven and things on high’ (Περὶ μεταρσίῳν καὶ μετεώρων), with a full list of the latter, cf. the whole of chs. 3.2–8; Ach. c. 33 ‘On winds, and that wind differs from exhalation’ (Περὶ ἀνέμων, καὶ ὅτι διαφέρει αὔρα ἀναθυμιάσεως) cf. ch. 3.7; Ach. c. 34 ‘On comets’ (Περὶ κομητῶν) cf. ch. 3.2. The sparse parallels as to content, not mentioned by Diels, Maass, or Di Maria, will be cited at the witnesses for chs. 3.2 and 3.7. But Ach. c. 35 ‘On position’ (Περὶ θέσεως) and c. 36 ‘On motion’ are not about the earth but provide advice about how to use the armillary sphere, as is only proper in what has become an Introduction to Aratus. These chapters are followed by three more on the heavenly bodies.

6 Other Source Material

For the ultimate sources of much of the material contained in the Book we must go back to the Peripatos, and think of the otherwise lost sources used and

cited by Aristotle, Theophrastus and their predecessors. Important parallels for the meteorological chapters in A, including 3.15 on earthquakes (and also for the wider proximate tradition), are provided by the *Metarsiology* attributed *disertis verbis* to Theophrastus in two manuscripts. This text, now to be consulted in the edition with translation of the first complete version and provided with an extensive commentary by Hans Daiber (1992), may be no more than an (incomplete?) compendium (see overview at Sharples 1998b, 16–18), and its precise nature is not clear (see references at Taub 2003, 116). According to the catalogue of Theophrastus' works at Diogenes Laertius *V.P.* 5.44 the work consisted of two Books (Μεταρσιολογικῶν α' β'). The attribution is accepted by a majority of scholars, but has been challenged by Bakker (2010) 71–73, 95–97, 132–141, who adverts to the mixture of Peripatetic and purported Epicurean ingredients. But we see no cogent reason to question the attribution to Theophrastus; see below on the evidence in Proclus. Reitzenstein's study of 1928, containing as an appendix a German translation of the text as known at the time, with comments and parallels in the meteorological literature, is also still useful. The *Metarsiology*, extant as an independent *opusculum*, is relevant as a source and testifies to the (limited) influence of Theophrastus in the present Book. The absence of name-labels makes it even less likely that (originally) it belonged with the *Physikai Doxai* than the *De sensibus*, which does have them. The first editor and translator of this text, Bergsträsser (1918), followed by others, believed that an excerptor had removed the name-labels, but this seems unlikely.

Aristotelian and Theophrastean precedent is cited at the individual chapters below. Material deriving from or rather attributed to Plato is limited: a single reference pertaining to the *Theaetetus* in the meteorological section of the Book, one reference pertaining to the *Phaedo* and another one pertaining to the *Timaeus* in the section concerned with terrestrial matters. For many of the chapters it emerges again that the general approach depends on the (Aristotelian) methodology of question types, categories and diaeresis (often turned into diaphonia), while quite a few headings as well as issues and even the contents of several lemmata go back to Aristotle's *Meteorology* (in some cases via *Epitomai* of this work) in the meteorological part, and to *De caelo* 2.13 in the part concerned with terrestrial matters. For the grouping of phenomena in Aristotle's *Meteorology* according to material cause, efficient cause, and location see Wilson (2009) and (2013). *More scholastico* the *Placita* separate and distribute over different mostly very short chapters a series of individual themes relating to the earth (thus chs. 3.8–14), which Aristotle and the wider doxographical tradition use to discuss in connection with each other. But the short ch. 3.9 combines several issues, and we note that some of these issues are not par-

alleled in Aristotle. The earlier, properly meteorological chapters of the Book, on the other hand, tend to collect under one heading subjects treated by Aristotle in different (sets of) chapters of the *Meteorologica*.

Later Hellenistic sources are also utilized, though sparsely, with the exception of ch. 3.17 on tides, which treats an issue that became important only after Aristotle. Again we note its affinity with ch. 4.1, which likewise treats an issue that was not on Aristotle's agenda, and was only later discussed in the ps.Aristotelian *De inundatione Nili*. Hence the unusual name-labels in both these chapters. Otherwise updating is rather rare, the name-label Posidonius only being found in chs. 3.1 and 3.17.

A list of themes treated in Theophrastus' *Metarsiology* is found at Proclus in *Tim.* 2.120.30–121.7 (fr. 159 FHS&G): 'Theophrastus ... investigating whence the thunders, and whence the winds, and *what kinds of causes* there are of thunderbolts, lightnings, *presteres*, rains, snow, hail, which in his causal explanation of meteorological phenomena he rightly judged to be deserving of the appropriate conjectural account' (τὸν Θεόφραστον ... ζητοῦντος, πόθεν μὲν αἱ βρονταί, πόθεν δὲ ἄνεμοι, ποῖαι δὲ αἰτίαι κεραυνῶν, ἀστραπῶν, πρηστήρων, ὑετῶν, χιόνος, χαλάζης, ἃ δὴ καλῶς ποιῶν ἐν τῇ τῶν μετεώρων ἀ(τι)ολογίᾳ τῆς πρεπούσης εἰκοτολογίας καὶ αὐτὸς ἡξίωσεν.) In spite of the ascription in the manuscripts the attribution of this work to Theophrastus has been doubted, or even rejected, because of its penchant for multiple explanations, believed to be more appropriately Epicurean. See most recently the thorough discussion of Bakker (2016) 106–108, 145–153, who however admits that several chapters can only be of Peripatetic provenance (*ibid.* 148–152) and so comes down in favour of a treatise of mixed descent. But Proclus' list of phenomena—all of which as to content rather precisely correspond to themes in the *Metarsiology*, though the earthquakes are missing (but Proclus' list is not a pinax)—in our view alludes to multiple explanations. The plural ποῖαι δὲ αἰτίαι hardly means one single cause for each of the following, but alludes to the various options in each particular case and thus fits the layout of the *Metarsiology*. And Proclus explicitly attributes this treatment to *Theophrastus*. See also Sharples (1998b) xv and 228. For the chapter on winds see below, ch. 3.7 Commentary D(d). In several fragments attributed to Theophrastus *On Waters*, too, more than one causal explanation for a single phenomenon is mentioned, see frs. 211A FHS&G in Proclus (esp. τοῦτο ἐν εἶναι αἵτιον ὁμβρων) and 211B in Olympiodorus, cited below at E(b) General texts. Though we ourselves do not share them, we cite this work as by 'Theophrastus(?)' to indicate that doubts have been expressed.

7 Further Parallels and Sources

Meteorology as a separate subdiscipline of physics was established, as we know and have just recalled, by Aristotle in his *Meteorology*. For details see above, section 2, also for treatment of the earth in the *De caelo*; for references see below. A rough list of subjects treated in the part of theoretical philosophy ‘called meteorological theory’ (i.e. by Stoics) is found at Galen *Propr.Plac.* 8, p. 180.23–31 Boudon-Millot–Pietrobelli, text Lami: ‘Chrysippus and his followers’ (Χρύσιππος καὶ οἱ μετ’ αὐτοῦ) have shown what knowing about ‘the thunders and lightnings (cf. ch. 3.3) and earthquakes (cf. ch. 3.15) and hail and snow (cf. ch. 3.4) and rainbows (cf. ch. 3.5) and mock sun and streaks (cf. ch. 3.6) and the single or double halo often occurring about the sun or the moon or the triple (halo) sometimes appearing (there) (cf. ch. 3.5a), and everything else that belongs with what is called meteorological theory, is useful for’ (Greek text cited at Book 1.titulus et index, *capitulationes*). This information has only been available since the *editio princeps* of the full text of the *De propriis placitis* in 2005, so is not (yet) found in collections of Stoic fragments. Galen points out that this study is only useful for those who study theoretical philosophy, not for the practising physician. An even more cursory overview is found in the concluding paragraph of Seneca *Dial.* 12.20.2: ‘then (the mind) examines everything which, filled with terrors, lies between heaven and earth, this expanse disturbed by thunder, lightning (cf. ch. 3.3), blasts of winds (cf. ch. 3.7), and the rain and snow and hail (cf. ch. 3.4) that fall upon our heads’ (trans. Davie–Reinhardt LCL, slightly modified; Latin text cited below at Book 3.prooem. E(a)). We note a reference to the fear of these phenomena that is entirely lacking in A. An anonymous list is at Ioannes Lydus *De ostentis* c. 4.

The Stoic diaereses of the *physikos logos* (‘physical theory’, ‘account of physics’) at Diogenes Laertius *V.P.* 7.133, for which see M–R 2.1.96–110 and above, General Introduction section 2.8, mention meteorological subjects *ad finem* after subjects in psychology (see Introduction to Book 4 section 6), in the second subdivision of the *aitiologikon*. The study of these matters is shared between *mathematikoi* and philosophers. The examples given are ‘how clouds are formed (cf. ch. 3.4) and thunders (cf. ch. 3.3) and rainbows (cf. ch. 3.5) and halos (cf. ch. 3.5a) and comets (cf. ch. 3.2) and similar things (cf. ch. 3.1, 3.6–9)’. Diogenes next treats these subjects in the succinct overview of Stoic physics at *V.P.* 7.152–156, ll. 1294–1346 Dorandi. Discussion of matters concerning the earth here follows on after the treatment of the aerial phenomena just as in A. This treatment of things terrestrial, perhaps rather surprisingly, is interrupted by the division of the heavens in zones (cf. ch. 2.12), which is then followed by that of the earth in zones cf. ch. 3.14. This highlights the parallelism we have

noted in our commentaries on these two chapters. Accordingly, the Stoic system presented by him clearly shares a common tradition with the *Placita*.

In Epicurus' *Letter to Pythocles*, which makes no distinction in principle between celestial and meteorological phenomena, there is also no separate treatment of the topics concerned with the earth. Of those found in the Stoic system and in the *Placita*, only the earthquakes are mentioned, namely at Diogenes Laertius *VP.* 10.105–106, wedged in between *presteres* and hail (this is because of the way they are explained). Individual parallels between alternative explanations of meteorological phenomena listed by Epicurus and mutually conflicting Aëtian doxai will be cited and discussed at the chapters that are involved.

Commentary

A Witnesses

As discussed in the equivalent chapter of Book 1, for the title of the entire work and its individual books we must rely on the evidence of T, the only witness to cite the title of the original work and give the name of its author. The titles in P and those witnesses dependent on its tradition are expanded versions of the original title. For the title at the head of P's Book 3 the evidence in P^B is supplemented by the title in Q's translation, which he has this time cited in a very full version. On these titles see further Book 1.titulus et index Commentary C.

For the index of chapters P^B is the chief witness, though not all mss. contain it. One of the mss. of Q, Zāhirīya (Damascenus) 4871 contains a translation of the list and thus provides valuable additional evidence on the manuscript tradition. Daiber did not include it in his edition, but he has kindly provided the editors with a translation (see Appendix in vol. 4). On this translation and its source see further the Book 1.titulus et index Commentary A.

For this book Eusebius again supplies some additional evidence. In PE Book 15 he cites the chapter headings of chs. 3.9–12, 15 both in the pinax at the beginning of the book and in the excerpts themselves. He also mentions the headings of chs. 3.10–12, 15 in his summary at 15.32.8–10. The only reading of note is συνέστη in the heading of 3.15. Symeon Seth in his Preface also cites some titles and doxai from Book 3. See the texts cited in Book 1.titulus et index, *testes primi*.

For the question whether A's text contained the index see Book 1.titulus et index Commentary D. On the practice of prefacing texts with tables of content and chapter headings see Book 1.titulus et index Commentary D(e).

C *Book Title*

As emphasised in our discussion in Book 1.titulus et index Commentary A, the title for the entire work and each of its books must be based on the evidence of T. The titles in the tradition of P are secondary. P's title in the ms. Mosquensis for this book differs from that of Book 2, with the phrase ἐν ἐπιτομῇ qualifying Περί τῶν ἀρεσκόντων and indicating the method of the work. In fact this phrase is also found in the proem to Book 3 in A's original work. See our discussion on the relation between the titles of A and P in Book 1.titulus et index Commentary C.

D *Analysis of the Index*

(1) For a discussion giving the reasons why we are convinced that A's original compendium contained these indices at the beginning of each book, see M–R 2.196–204 and Book 1.titulus et index Commentary D(6) and D(e).

(2) For the methodology of the reconstruction of the index see Book 1.titulus et index Commentary D(3). We argue that priority must be given to the chapter headings in the text of the chapters themselves, since A will have based his index on these when he compiled the work. It is thus to be assumed that the list of chapter headings in the index accurately reflects the chapter headings in the text of the Book. In this book there are only two chapters for which the heading in the reconstructed list differs from what is transmitted in the manuscripts: for ch. 3.13 we have given the preference to the chapter heading in S; in ch. 3.14 in the mss. the two parts of the heading are connected with καί. In all other cases the intra-textual chapter heading has differing degrees of support in the pinax as recorded in the manuscripts. The reader is advised to study the apparatus criticus both above and to the headings of individual chapters.

(3) For discussion of chapter headings in P^B, who often opts for the longer variants, see the comments in our Commentary on individual chapters below (section C). As was the case in Book 2, Q shortens or alters the headings in a number of cases: see chs. 3.1, 3.2, 3.3, 3.9. On Q's headings see further Book 2 titulus et index Commentary D(3).

D(e) *Other Evidence*

For further discussion on the use of pinakes (tables of contents) in ancient works see Book 1.titulus et index Commentary D(e).

E *Further Related Texts*

For an extensive list of parallel texts relating to the compilation and use of pinakes (tables of contents) or indices of chapter headings, see Book 1.titulus et index Commentary E.

Commentary

A Witnesses

The witnesses are limited. They are restricted to P^B and P^Q, with further only a corrupt remnant of the lemma in P^G, which has been added to the end of ch. 73,

the last chapter from Book 2. It is surprising that he appears to have included this brief section. The other procœmia in Books 1, 2 and 4 were omitted.

B *Proximate Tradition and Sources*

The representatives of the proximate tradition, viz. Ach, *Scholia in Aratum*, Pliny, Seneca, and Eusebius all dwell explicitly at greater or lesser length on the distinctions between the main divisions of physics, the boundaries between them, and the places where they are to be treated. The famous proem of Aristotle's *Meteorology* is the ultimate source of inspiration. Its reverberation in the *De mundo* is quite close to the proximate tradition, and also to A.

C *Chapter Heading*

The introductory comments in Books 1, 2, 3 (twice) and 4 fall outside the division into chapters and consequently have no chapter heading.

D *Analysis*

a Context

These lines indicate the opening of a new Book, starting a further division of physics, namely what happens in the atmosphere (τὰ μετάρσια). The next subdivision is announced at ch. 3.8.2, namely the series of chapters dealing with the 'things relating to the earth' (τὰ πρόσγεια).

A is bent on following and establishing an order which goes from the periphery to the centre not only in the treatise as a whole (see M–R 2.1.40–41, above General Introduction section 2.8), but also in the present book: a cluster of nine chapters dealing with atmospheric phenomena from the Milky Way (ch. 3.1) via comets (ch. 3.2), thunder and lightning (ch. 3.3), clouds etc. (ch. 3.4), rainbow (ch. 3.5), halo (ch. 5.a), rods (ch. 3.6), winds (ch. 3.7) and summer and winter (ch. 3.8), to a cluster of nine chapters (ch. 3.9–17) dealing with earth and sea. P ch. 1.18, on the halo, an atmospheric phenomenon, is in the wrong place.

b Number–Order of Lemmata

There is only one lemma, which is found only in P and his tradition. S and T write their own treatises, so obviously have no use for the introductory passages of A.

c Rationale–Structure of Procœmium

It provides a brief description of the contents of what follows in relation to what precedes, thus emphasizing the unity of the work, since it mentions not only the *ourania* but also the *metarsia*. It also highlights the unity of the Book, because it mentions not only the *metarsia* but also the 'position of the earth',

i.e. refers to ch. 3.11 and its immediate context. In the introductory passage at ch. 3.8.2 below both these parts are mentioned, the one as having been treated, the other as to be treated. For such authorial passages cf. the proems of Books 1, 2 and 4, and the embedded introductory passages at chs. 3.5.1 (3.8.2 has been cited at loci Aetiani above); see further M–R 2.1.42–59.

d Further Comments

§1 Such staunchly traditional passages introduce the writer in an authorial role.

e Further Evidence

From the proem of Aristotle's *Meteorology* to substantial passages in the *De mundo*, Seneca, Diogenes Laertius and Eusebius, see above, *Testes secundi*, and section E(a) & (b) below.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

(1) The witnesses for P are P^B and P^Q with ten lemmata, P^G with eleven lemmata (i.e. one extra), and P^S for the heading only. Psellus includes several headings from the meteorological section of the *Placita* in his *De omnifaria doctrina*, but the contents of his chapters derive from elsewhere. E does not copy out any of the first eight chapters of the book.

(2) The brief chapter of S, which has the same ten lemmata in the same order as the matching lemmata in P, combines the first sentence of the Aristotle lemma with a short excerpt from AD, a type of coalescence found more often in the *Anthology*, see Diels *DG* 75 n. 2, M–R 1.249–254, and Jeremiah at M–R 4.286 and 353. S appears to have written out the chapter in full minus one lemma, and P to have refrained from abridging it.

(3) G has combined P§5 and §6, omitting the name-label Parmenides. It should also be noted that he has preserved an interesting lemma dealing with the Stoics, which would appear to have been lost in both S and the further tradition of P, a rare event; see discussion at section D(c)(3) below, and for a preliminary overview of extra lemmata in G see M–R 1.149–150. For comparable extra evidence in chapters of G cf. also above, ch. 1.1, Commentary A. One would have assumed that the chapter has survived in full because of the complete agreement between P and S and the continuous sequence of lemmata in

S, of which those corresponding with lemmata in P are in the same order as in P. Surprisingly, however, the extra lemma in G—rejected by Diels—shows that this is not the case. That it is complete when we include this lemma is not certain either, because the proximate tradition provides doxai (of Theophrastus and Diodorus) not represented here.

We note, finally, that T does not make use of any material from Book 3.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Quite numerous parallels are found, not only in the usual more or less historiographical sources, but also in literature concerned with celestial phenomena, both in scientific or partly scientific contexts (Lucretius, Manilius, *Scholia on Aratus* and literature deriving from Aratus) as well as in literature with a moral purpose (Cicero's *Somnium Scipionis*, Philo's *De providentia*, Macrobius' *Commentary*). There is no discussion of the Milky Way in Theophrastus(?) *Metarsiology* and Seneca's *Naturales quaestiones*.

(2) *Sources.* The matrix of the chapter derives from Arist. *Mete.* 1.8, where the topic to be treated, the cause and nature of the Milky Way, is formulated and dialectical discussion of the views of others announced. More particularly, our §§2–4 (some Pythagoreans, other Pythagoreans, some people) and §§7–8 (Democritus and Anaxagoras) are derived from this Aristotelian chapter virtually verbatim. §9 as to contents represents the doctrine of *Mete.* 1.7–8. Aristotle too includes a mythical explanation in his overview, but only at second hand, namely the Phaethon story attributed to 'some Pythagoreans' (refuted by him along with the others cited).

Diels in the *Theophrasteorum conspectus* at DG 138 places the indeed virtually identical formulations of the Anaxagorean tenet cited by Diogenes Laertius and Hippolytus (see below section E(a)§7) next to §5 of the present chapter in his parallel columns, thus deriving them from Theophrastus. But they are closer to the original presentation by Aristotle (see below section E(b)§7) than to the *Placita* lemma. Neither in Aristotle nor in §5 do we find the ἀνάκλασις of Hippolytus and Diogenes Laertius. But the two parallel versions of section E(a)§7 will certainly derive from a common intermediary source, perhaps Theophrastus. For parallel evidence related to the issue of the salinity of the sea see below, ch. 3.16 Commentary B.

In his wonderful and unjustly forgotten, or at least neglected, commentary on the *Meteorology* Ideler (1834) 1.409 pointed out that the meteorological *placita* in Stobaeus, and in those sources with which Stobaeus as a rule agrees (i.e. ps.Plutarch etc.), *depend on Aristotle*: 'quibus accedit, quod Stobaeus et reliqui, quibuscum ille [sc. Stobaeus] consentire solet, in enumeratione placitorum, fere unice ab Aristotele pendere soleant', etc. See also *ad* chs. 3.5 and 3.5a (olim 3.18)

below. Diels unfortunately failed to profit from this invaluable insight, or maybe chose to ignore it because it conflicts with the Diels/Usener hypothesis regarding Theophrastus as the source of such parallel later accounts. There is nevertheless a telltale item at Democritus 68A91 DK 'über die Milchstr.', where a reference to the *Meteorology* cited in the Anaxagoras chapter is followed by an abstract from Alexander's comments, and by quotations of A 3.1.8 and the parallel in Ach. Elsewhere, too, such or similar sequences are to be found, e.g. Aristotle plus A at Anaxagoras 59A81 DK and 59A84 DK, at Empedocles 31A63 DK, at Xenophanes 21A47 DK, at Anaximenes 13A21 DK, and A plus Aristotle at Anaxagoras 59A85 DK.

C Chapter Heading

Of the standard umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), covering the question types of substance and cause (διὰ τί), and the category of place. It is not easy to choose between P's version Περὶ τοῦ γαλαξίου with κύκλου and S's Περὶ γάλακτος without it, as κύκλου's presence may be an anticipation of the first word of §1, and its absence an instance of the usual sort of Stobaeian heading abridgement. The word is not really needed when the substantive used is γαλαξίας, which also occurs in §1 in both P and S, while Περὶ γάλακτος is perhaps not immediately clear. Ach and G (text Jas) at any rate have Περὶ τοῦ γαλαξίου without κύκλου, which might tip the balance towards leaving it out. S's γάλακτος may reflect Aristotle's earlier usage, to which Alexander adverts. It may do so either via the tradition or as the result of an archaizing move, as Aristotle's embedded heading is περὶ ... γάλακτος. Ach's remark *Isag.* c. 24, p. 38.4–5, that Aratus l. 476 uses γάλα because γαλαξίας does not fit the metre (διὰ τὸ μὴ δύνασθαι αὐτὸ ἐντεθῆναι εἰς ἔπος τοῦ γαλαξίου τὸ ὄνομα) is not wrong, but he fails to note the Aristotelian usage (cf. Ideler 1834, 1.411, who calls this observation 'inept' and cites Parmenides 28B11.2 DK γάλα τ' οὐράνιον as precedent). Psellus' long and composite heading is not relevant for the *constitutio*. With some misgivings we have preferred P's reading nevertheless.

D Analysis

a Context

The chapters in A Book 3 dealing with meteorological subjects for a substantial part derive from specific sections, or proto-chapters, in Aristotle's *Meteorology*, the first work, as far as we know, to bring these topics together in a systematic way. The derivation holds for the issues themselves as well as for part of the actual contents. But the order of treatment in the *Placita* is not the same as in the *Meteorology*, and not the same as in Seneca's *Naturales quaestiones* either.

A begins with the Milky Way at ch. 3.1 to continue at ch. 3.2 with comets and shooting stars, whereas Aristotle discusses shooting stars and similar phenomena at *Mete.* 1.4–5, continues with comets in *Mete.* 1.6–7, and only then discusses the Milky Way in *Mete.* 1.8. Note however that in the proem the order of themes to be discussed is different from the actual order of treatment, namely the Milky Way first and not third, and then the others (*Mete.* 1.1 338b22–24 περί τε γάλακτος καὶ κομητῶν καὶ τῶν ἐκπυρουμένων καὶ κινουμένων φασμάτων). This again shows that such an overview is not an index of contents in our sense of the word (or in that of the pinax of later literature). Aristotle has just said that phenomena such as these take place in the region *bordering on* that of the movements of the stars, and therefore not *in* the astral region. He presumably has Anaxagoras' and Democritus' theory of the Milky Way in mind (discussed *Mete.* 1.8 345a25 ff.), who explain it as the light produced by a collection of small (fixed) stars. It is therefore a matter of some programmatic importance to mention the Milky Way qua non-astral phenomenon first, and only then the comets, who according to the same authorities are to be counted among the *planets* (*Mete.* 1.6 342b27 ff.). By moving the chapter on the Milky Way, which contains references to the stars, to the very beginning of the Book A has it immediately follow upon the heavenly phenomena treated in Book 2, so gives it a transitional function, just as ch. 1.30 at the end of Book 1 has.

A may be indebted to the tradition and view represented by Ptolemy and al-Bitriq's source and echoed in the late commentators, for which see below, Section D(e). As a matter of fact the Milky Way is the first and highest phenomenon in Aristotle's sublunary cosmos, so treating it first restores the hierarchy. Aristotle bundles things more roughly together in two successive layers of the sublunary cosmos, viz. the upper region where shooting stars, comets and the Milky Way are found (*Mete.* 1.4–8), and the layer following upon this one and closer to the earth, where we have rain (and similar phenomena, treated a bit later), and clouds, and winter and summer, and winds (*Mete.* 1.8–13). For the explanation of A's order see further Introduction to Book 3, section 2, on the subject matter of the Book, and Book 3, *Prooemium* at Commentary D(a).

b Number–Order of Lemmata

P^B, confirmed by P^Q, has ten lemmata, and S has ten lemmata too, the same as P^{BQ}. P^G seems to have ten lemmata as well, but because in P^G §5 has been coalesced with §6 and the name-label Parmenides has dropped out, this additional witness in fact has, or rather attests to, eleven lemmata, ten of which are paralleled in P^{BQ} and S while one, §10, is not paralleled in either P^{BQ} or S. As the lemmata order is the same in all witnesses (assuming that G's §10 is found in its

original position, see below), this order has to be preserved unchanged. Unsurprisingly our order is the same as that of Diels in the *DG*. We have however augmented the number of lemmata not only by including the extra paragraph preserved by G, but also by splitting up Diels' first lemma into three separate paragraphs, following our practice of having a separate lemma for every doxa if it is introduced by a different name-label.

c Rationale–Structure of Chapter

(1) *The definition.* This is one of the eight *Placita* chapters to begin with an anonymous definition, clearly meant to be nominal (or conceptual) and valid in all cases (see above ch. 1.9, Commentary D(c)(1) and D(b)(2)). The diaphonia starts at §2.

(2) The chapter's contents are paralleled in a multiplicity of other sources. There is a clear and crucial diaphonia between §§2–3 (two groups of Pythagoreans), lemmata that attribute real existence to the Milky Way, and §4 (doxa purported to be of other Pythagoreans?), a lemma that declares it to be an optical illusion. §§5–§11, too, in various ways declare the Milky Way to be real, so not illusory. This general diaphonia is of decisive importance for the account of the meteorology as a whole. In the remainder of the chapter the view represented by §4 does not occur again, unless one wishes to include the views listed at §§6–7 in the class of optical illusions, which however is hardly feasible. To be sure, the Anaxagorean parallels at Hippolytus *Ref.* 1.8.8, and Diogenes Laertius *V.P.* 2.9 posit that the Milky Way is a reflection (ἀνάκλασις) of stars that are not illuminated by the sun, but no reflection is mentioned in our §7, while the συναυγασμός of our §8 is, so to speak, *toto caelo* different from ἀνάκλασις. One also wonders how these stars come to be reflected, so what is in Hippolytus and Diogenes must derive from a garbled interpretation of a formula similar to what is found in A. In the next chapter moreover, 3.2.3, a similar doctrine as applied to comets etc. is attributed (as in Aristotle) to both physicists together: 'Anaxagoras Democritus (say they are) a combination of two or even more stars according to their giving off light together (κατὰ συναυγασμόν).'

From §5 to §11 we accordingly have various explanations of the Milky Way as a real physical phenomenon. The first of these, §5 Metrodorus, is similar to the anonymous doxa of §3, the difference being that the (Pythagorean?) Anonymi speak of the past and Metrodorus of the present. §6 Parmenides is the first to provide a characterization in terms of physical elements (cf. §§9–11), but the reference to the milky colour also turns it into an appendix to the descriptive definition of §1. §7 Anaxagoras would be incomprehensible without its Aristotelian precedent; in fact, §§7–8 derive from a single sentence in Aristotle.

(3) §§9–11 (Aristotle, the Stoics, Posidonius) take us beyond the Presocratics and are additions to the originally for the most part Aristotelian data concerned with the views of others. The substance of the Milky Way is fiery: an inflammation of the dry exhalation that becomes a tail of fire according to Aristotle §9, a loose-textured form of aetherial fire according to the Stoics §10, and a solid fiery structure according to Posidonius §11. The fineness of texture of §10 provides a contrast with the blend of fine and compact elements of §6, as does the term in between the opposed terms ‘rare’ and ‘compact’ of §11.

(4) The rather unsatisfactory structure of the chapter can be explained as the result of a restructuring by means of successive additions to this Aristotelian matrix, which nevertheless still determines the exposition. The tenets of §§2–4 plus §§7–8 derive from Aristotle, but in *Mete.* 1.8 the order is different, namely tenets anticipating §§2–3 followed by tenets anticipating §§7–8 followed by a tenet anticipating §4. There are no Aristotelian antecedents of §§5–6 (and neither, of course, of §§9–11). The restructuring, locating the view that the Milky Way is an optical illusion immediately after the Pythagorean views, thus bypassing those attributed to Anaxagoras and Democritus, has the effect of stating a crucial diaphonia (already prefigured in Aristotle) at the very beginning. The views of §5 Metrodorus and §6 Parmenides come next, as appendixes to respectively §3 (Pythagoreans?) and §1 (definition). §§6–7, tenets that in Aristotle came after those corresponding to §§2–3, thus come after and not (as in Aristotle) before the paragraph about the optical illusion.

What is more, the single view attributed in Aristotle to both Anaxagoras and Democritus has now been split up into two different views. Even so, the Aristotelian sequence is followed and its peculiarities are preserved, though modified by the switch between the contents of §§7–8 and §4, the interpolation of §§5–6, and the splitting-up of §§7–8. It is obvious that the material referring to Aristotle himself and the Stoics could only be introduced *ad finem*.

A sort of ring composition effect is involved in the presence of specific diaphoniae at the beginning and end of the chapter, an important one first, a less important one last. The first, as noted, is the result of a modification of the Aristotelian order, the purpose of which is the enhancing of diaphonic clarity *more doxographico*. The tail of the chapter has likewise been arranged according to doxographical custom.

d Further Comments

General Points

What is new in comparison with Aristotle, and quite interesting, is the explicit effort to connect the Milky Way (according to some) qua optical phenomenon,

as in ch. 3.1, with the discussion of the rainbow qua optical phenomenon in ch. 3.5 (the latter, as it turns out, according to Aristotle himself) by means of the remark (at A 3.1.4) ‘just as what happens in the case of the rainbow and the clouds’ (ὅπερ καὶ ἐπὶ τῆς ἱριδος καὶ ἐπὶ τῶν νεφῶν συμβαίνει).

Individual Points

§1 Visibility and colour: see Pàmias y Massana–Zucker (2013) nn. 682–683.

§3 Doxa attributed to Oenopides of Chios and others at Ach c. 24, p. 37.13–16; for Oenopides cf. section D(e) below.

§4 Doxa attributed to the mathematician Hippocrates of Chios by Alex. in *Mete.* 38.28–32. This theory as applied to comets is attributed to Hippocrates at Aristotle *Mete.* 2.6 342b35–343a4, and cited (without name-label) in a similar diaphonia at the beginning of the next chapter, 3.2.2, *ubi vide*. Because he was a mathematician this Hippocrates was later considered to be a Pythagorean (Burkert 1972, 314 n. 77, 322 n. 115), though not always, see Alexander in *Mete.* 26.27–28 and, following him, John Philoponus in *Mete.* 77.8–9. Note that the phrase formulating the present doxa is a modified echo of Aristotle’s sentence: Aristotle writes that our visual rays are reflected to the sun (so also the parallel doxa at ch. 3.2.2), while our lemma posits that the sun’s rays are reflected towards the heaven. (The heavenly vault is of course the place where we ‘see’ this projection and so locate the Milky Way). We then hear that this is just like what happens with the rainbow and with the clouds. The rainbow qua phenomenon of reflection is the theme of a large section of ch. 3.5, ‘On the rainbow’, while clouds as involved with other optical phenomena are found in the next chapter, 3.2.5–6. We note that it concerns *both* rainbow and clouds; accordingly, we have retained the καὶ between ἱριδος and ἐπὶ τῶν νεφῶν as found in P^B. That the sun bends back its rays by way of a cloud that serves as a mirror is not stated explicitly, but only suggested.

The parallels for these views of Hippocrates (and Aeschylus) in Aristotle and elsewhere are cited below, section E(b)§4 and at ch. 3.2, section E(b)§4. Most remarkably, views concerned with *physics* (cosmology, or meteorology) are attributed to a famous *mathematician* concerned with reflection from the point of view of optics or catoptrics. For the views of Aristotle and the Stoics on fields of study shared by philosophers on the one hand and mathematicians and (mathematical) astronomers on the other see M–R 2.1.97–109. Diogenes Laertius *V.P.* 7.133 on the subpart of physics shared by (Stoic) philosophers and these scientists mentions as examples the theory of vision and the explanation of mirror images, and ‘how ... rainbows and haloes and comets and similar things come to be’ (πῶς ὁρῶμεν, τίς ἡ αἰτία τῆς κατοπτρικῆς φαντασίας, ὅπως νέφη συνίσταται, βρονταὶ καὶ ἱριδες καὶ ἄλλως καὶ κομήται καὶ τὰ παραπλήσια). Hippo-

crates on the Milky Way, the rainbow and clouds constitutes the earliest known example of this collaboration between philosophers and mathematicians, in the form of a personal union.

§6 We know that Parmenides did in fact discuss the origin of the Milky Way; see the announcement at 28B1 DK.

§10 It is quite certain in our view that §10, name-label the Stoics, though rejected by Diels, is Aëtian. One would not expect G to add this *sua sponte*. Diels did not always pay sufficient attention to diaphonic structures. The diaphonia of §10 Stoics with §9 Aristotle is impeccable. Aristotle's Milky Way is said to be located 'underneath the aether and lower than the planets'. These two qualifications are tautological *ad sententiam* in the context of Aristotle's cosmology (maybe this is why Q omits to translate ὑπὸ τὸν αἰθέρα), and specifically serve to make explicit the opposition to the Stoic Milky Way, whose double qualification 'of aetherial fire, higher than the planets' is not tautological. The condition of the Milky Way according to the Stoics in general is also opposed to that of Posidonius according to §11: a loose-textured structure according to the former, a solid one according to the latter. What is more, it follows that according to Posidonius the Milky Way is located even higher than the stars, viz. between the sphere of the fixed stars and the highest zone, that of the pure αὐγή; see Boyancé (1936) 68–70. Thus the order *ad finem* is: (§9) Milky Way lower than the planets, (§10) higher than the planets, (§11) higher than the stars—an interesting application of the category of place.

A 'new' Stoic fragment: Because Diels rejected the contribution of G the general Stoic view has remained unknown! The lemma should be added to our collections of Stoic fragments. The doctrine fits in well with Stoic cosmology. The formula αἰθερίου πυρὸς ἀραιότητα is paralleled at Sen. *Nat.* 1.2.4: *tenuis aether*. See further above, section D(c).

§11 Kidd (1999) 182, commenting on this lemma and its parallel in Macrobius, says that 'it is the only certain surviving reference to the Milky Way in Stoicism'. But see the previous paragraph, §10, *ad finem*.

e Other Evidence

At the beginning of his account of the Milky Way (*in Somn.* 1.15.3–8; 1.15.3–7 are printed as Posidonius F 130 E.-K., 298a Th.) Macrobius *disertis verbis* not only tells us that the authorities to be cited differ among themselves, but also that some of them provided mythical and others physical explanations. He will only provide the latter: views of Theophrastus (fr. 166 FHS&G, paralleled in Philo), Diodorus, Democritus (68A91 DK, paralleled in A, viz. §8), and Posidonius (T 68 E.-K., 298a Theiler), mentioned last apparently because the most influential

(*cuius definitioni plurium consensus accessit*). The Posidonius lemma is only partly paralleled in the brief lemma at ch. 3.1.11.

Such a blend of the mythical and the scientific is indeed found in other representatives of the proximate tradition, namely in Philo of Alexandria, Achilles, and Manilius, who refer to the stories of Phaethon and of the milk from Hera's breasts. Philo, too, rejects certain explanations because they are mythical. Both Achilles and Philo (the latter missed by Pàmias i Massana–Zucker) refer to Eratosthenes *Cat.* c. 44. Olympiodorus, who closely follows Aristotle and (apparently) Alexander of Aphrodisias' paraphrastic commentary of the *Meteorologica*, also dwells on the mythical nature of some of the explanations that are cited by Aristotle, and rejects these explanations. For Alexander, who does mention this mythical status, this is no big issue, while Aristotle himself does not refer to it at all (see Mansfeld 2013a).

Ach c. 24 begins with the definition, paralleled in §1, then tells the story of Hera's spent milk after Eratosthenes, next briefly cites Theophrastus' view but not his name, and continues with Oenopides' view (41.10 DK) that the Milky Way is the former orbit of the sun (a view paralleled at §2, where no name-label), which arrived in its present orbit along the Zodiac because of the dinner of Thyestes (a detail not paralleled in A, but briefly cited by John Philoponus *in Mete.* 101.34–36). This explanation is rejected by Ach, because those who defend it are hard put to justify in the same way the actual orbits of the moon and the five planets along the Zodiac. Then, anonymously, the view of Democritus paralleled in A (and Manilius), but with a different explanation: the many starlets seem to be one because of the distance of the heaven from the earth, compare what happens when you besprinkle something with numerous fine grains of salt. But presumably it is better to say that it is derived from clouds, or a transparent compression of air of a circular shape. Then line 476 of Aratus' poem is quoted, who is said to have called it γάλα because the word γαλαξίας does not fit the hexameter. In conclusion the name is explained (it is 'white and transparent'), and its position on the heavenly globe described.

Manilius deals with the Milky Way at 1.684–804. He describes its position on the heavenly globe in astronomical detail, then tells us that it is very visible (cf. A§1 and Ach), suggests that maybe the firmament is coming apart (a scary explanation unparalleled elsewhere, but the converse of the next view cited), or that this is the scar marking the place where the skies came together (a blend of the tenets of Theophrastus and Diodorus, cf. Philo, Manilius and Ach; here too without name-label). Then we have a reference to the possibility that the sun's horses travelled this path in the past, paralleled in Ach, Aristotle, and §3 (see below). Next are the mythical stories of the consequences of Phaethon's heavenly voyage, paralleled in Aristotle, Philo and §2, and of the milk flowing from

the breast of the queen of the heavens (cf. Philo and Ach). These are followed by a brief version of the tenet of Democritus (paralleled in A, Ach and Macrobius), without name-label. Manilius ends with a long account of the heroic souls who have gone up to the Milky Way as their dwelling place.

A's deviation in chs. 3.1–3 from Aristotle's actual order of treatment is precisely paralleled in ibn al-Bitriq's Arabic paraphrase of Aristotle's *Meteorology*, which derives from a Greek original (published by Schoonheim 2000). Lettinck (1999) 76 points out that al-Bitriq's text differs from Aristotle's view in considering the Milky Way to be a heavenly phenomenon, not an atmospheric one, and that this may have been his reason for moving the theme to the beginning. (But as we have noticed in Aristotle's sublunary cosmos the Milky Way actually comes first, although it is discussed later.) Aristotle's view of the Milky Way qua atmospheric phenomenon is criticized by Olympiodorus (who cites 'the great Ammonius') and John Philoponus. See below section E(b) General texts, and Tihon (1976) 167–172 and Lettinck (1999) 73–74. The compendium of Hunayn ibn-Ishaq published and translated by Daiber (1975) has the comets and meteors (ch. 11), red colouring of the air i.e. aurora borealis (?) (ch. 12), and Milky Way (ch. 13) in an idiosyncratic position *ad finem*, with the Milky Way at its very end; according to Daiber (1975) 7 it is clear that in this final section 'ausschliesslich Lichterscheinungen behandelt werden'. Isidore of Seville, on the other hand, follows the trend by placing the Milky Way among the celestial phenomena in Book 3 of the *Etymologiae*.

(2) 'orbis' hic idem quod circus in lactei appellatione significat. solus ex omnibus his est subiectus oculis, ceteris circulis magis cogitatione quam visu comprehendendis.*

§2 Pythagoreans: Manilius 1.735–749 *fama etiam antiquis ad nos descendit ab annis / Phaethontem patrio curru per signa volantem, / dum nova miratur propius spectacula mundi / et puer in caelo ludit curruque superbus / luxuriat nitido, cupit et maiora parente, / deflexum solito cursu, curvisque quadrigis / monstratas liquisse vias orbemque recentem / imposuisse polo, nec signa insueta tulisse / errantis meta flammās currumque solutum. / quid querimur flammās totum saevisse per orbem / terrarumque rogum cunctas arsisse per urbes? / cum vaga dispersi fluitarunt fragmina currus, / et caelum exustum est: luit ipse incendia mundus, / et vicina novis flagrarunt sidera flammis / nunc quoque praeteriti faciem referentia casus.* **Capitula Lucretiana** at DRN 5.396 *de Phaetonte solis filio.*

§3 other Pythagoreans: Manilius 1.729–734 *an melius manet illa fides, per saecula prisca / illac solis equos diversis cursibus isse / atque aliam trivisse viam, longumque per aevum / exustas sedes incoctaque sidera flammis / caeruleam verso speciem mutasse colore, / infusumque loco cinerem mundumque sepul-tum?*

§7 Anaxagoras: Diogenes Laertius V.P. 2.9 (on Anaxagoras, 59A1 DK) καὶ τὸν γαλαξίαν ἀνάκλασιν εἶναι φωτὸς (τῶν ὑπὸ) ἡλίου μὴ καταλαμπομένων {τῶν} ἄστρον. **Hippolytus** Ref. 1.8.10 (on Anaxagoras, 59A42 DK) τὸν δὲ γαλαξίαν ἀνάκλασιν εἶναι τοῦ φωτὸς τῶν ἄστρον, τῶν μὴ καταλαμπομένων ὑπὸ τοῦ ἡλίου.

§8 Democritus: Manilius 1.755–757 *an maior densa stellarum turba corona / contextit flammās et crasso lumine candet, / et fulgore nitet collato clarior orbis?* **Macrobius in Somn.** 1.15.6 *Democritus (—) innumeras stellas brevesque omnes, quae spisso tractu in unum coactae, spatiis quae angustissima interiacent opertis, vicinae sibi undique et ideo passim diffusae lucis aspergine continuum iuncti luminis corpus ostendunt.* **Kompendium der aristotelischen Meteorologie** c. xiii.325 ff. Daiber *Der Bericht über die Milchstrasse.* Ihre Ursache ist: ... [see below, ad §8] *an der Stelle, an welcher die Milchstrasse*

erscheint, sind viele nahe beieinanderliegende leuchtende und nicht leuchtende Sterne. Wenn nun ihr Licht sich in der entflammten Luft ausbreitet, erscheint in ihr jenes Licht, welches 'milchartige Milchstrasse' genannt wird.

§9 **Aristotle:** Arius Didymus at Stob. *Ecl.* 1.27.7 [attributed to 'perhaps' AD by Diels ad loc, but printed as A 3.1.7], p. 226.21–26 (on Aristotle) τὸν γὰρ κύκλον ἐν ᾧ δοκεῖ θεωρεῖσθαι μέγιστον ὄντα, πλήρη τῶν μεγίστων ὑπάρχειν καὶ λαμπροτάτων ἄστρον καὶ ἔτι τῶν σποράδων καλουμένων, διὰ ταῦτα συνεχῶς πλείστην περὶ τοῦτον ἀθροίζεσθαι τὸν τόπον τὴν ἀπὸ τῆς γῆς ἀναθυμίασιν καὶ ποιεῖν τὴν τοῦ γάλακτος φαντασίαν. **Olympiodorus in Mete.** 45.14–16 μετὰ δὲ τὸν κομήτην ἐρεῖ καὶ περὶ γαλαξίου, ἐπειδὴ ὁ γαλαξίας οὐδὲν ἕτερόν ἐστιν εἰ μὴ κομήτης κυκλικός. **Kompendium der aristotelischen Meteorologie** c. xiii.323 ff. Daiber *Der Bericht über die Milchstrasse. Ihre Ursache ist: Die der Himmelssphäre benachbarte Luft ist entflammt und feurig* (for the sequel see above §8).

§11 **Posidonius:** Macrobius in *Somn.* 1.15.7 sed Posidonius (F 130 E.-K., 298a Theiler), cuius definitioni plurium consensus accessit, ait lacteum caloris esse siderei infusionem quam ideo adversa zodiaco curvitas obliquavit, ut quoniam sol numquam zodiaci excedendo terminos expertem fervoris sui partem caeli reliquam deserebat, hic circus a via solis in obliquum recedens universitatem flexu calido temperaret.

b Sources and Other Parallel Texts

General texts: Aristotle *Mete.* 1.8 345a11–13 ὅπως δὲ καὶ διὰ τίν' αἰτίαν γίγνεται καὶ τί ἐστὶ τὸ γάλα, λέγωμεν ἤδη. προδιέλθωμεν δὲ καὶ περὶ τοῦτου τὰ παρὰ τῶν ἄλλων εἰρημμένα πρῶτον. **Eratosthenes Cat.** 44, p. 131 Pāmias I Massana–Zucker Γαλαξίας. οὗτος γίνεται ἐν τοῖς φαινομένοις κύκλοις, ὃν προσαγορεύεσθαί φασι γαλαξίαν· οὐ γὰρ ἔξῃν τοῖς Διὸς υἱοῖς τῆς οὐρανίου τιμῆς μετασχεῖν εἰ μὴ τις αὐτῶν θηλάσειε τὸν τῆς Ἥρας μαστόν. διόπερ φασὶ τὸν Ἑρμῆν ὑπὸ τὴν γένεσιν ἀνακομίσεια τὸν Ἡρακλέα καὶ προσσχεῖν αὐτὸν τῷ τῆς Ἥρας μαστῷ, τὸν δὲ θηλάζειν· ἐπινοήσασαν δὲ τὴν Ἥραν ἀποσεῖσασθαι αὐτόν, καὶ οὕτως ἐκχυθέντος τοῦ περισσεύματος ἀποτελεσθῆναι τὸν Γαλαξίαν κύκλον. **Ptolemy Alm.** 8 c. 2, 2.1.170.1–179.22 Heiberg περὶ τῆς θέσεως τοῦ γαλακτίου κύκλου (too long to quote). **Alexander of Aphrodisias in Mete.** 37.8–39.4 ἰστορεῖ (sc. Aristotle whom Alexander is paraphrasing) δὲ τῶν μὲν καλουμένων Πυθαγορείων τινάς (cf. §2) ὁδὸν λέγειν εἶναι τὸν κύκλον τοῦτον τοὺς μὲν τῶν ἀστέρων τινὸς τῶν ἐκπεσόντων κατὰ τὴν λεγόμενῃ ἐπὶ Φαέθοντος γενέσθαι φθορὰν ἐκπυρώσεως γενομένης, οἱ δὲ τινές (cf. §3) φασιν αὐτὸν τὸν ἥλιον πρότερον ταύτην φέρεσθαι· διὸ καὶ διακεκαῦσθαι τὸν τόπον τοῦτον ὑπὸ τῆς φορᾶς αὐτοῦ. ... Ἀναξαγόρας (cf. 59A80 DK) δὲ καὶ Δημόκριτος (68A91 DK) (cf. §§7–8) φῶς εἶναι τὸ γάλα λέγουσιν ἄστρον τινῶν. ὁ γὰρ ἥλιος νύκτωρ ὑπὸ γῆν ἰὼν ὅσα μὲν περιλάμπει τῶν ὑπὲρ γῆς ὄντων ἄστρον, τούτων μὲν μὴ γίνεσθαι φασιν φανερόν τὸ οἰκεῖον φῶς ἐμποδιζόμενον ὑπὸ τῶν τοῦ ἡλίου ἀκτίνων· ὅσοις δὲ ἡ σκιά τῆς γῆς ἐπιπροσθούσα ἐπισκοτεῖ, ὥς μὴ ἐπιλάμπεσθαι τῷ ἀπὸ τοῦ ἡλίου φωτὶ, τούτων δὲ τὸ οἰκεῖον φῶς ὁράσθαι, καὶ τοῦτο εἶναι τὸ γάλα. ... τρίτην δὲ φησι δόξαν (cf. §4) εἶναι περὶ τοῦ γάλακτος τὴν λέγουσαν ἀνάκλασιν εἶναι τὸ γάλα τῆς ἡμετέρας ὕψεως ἀπὸ τινος ἀναθυμιάσεως, ἥ τις εἶναι δοκεῖ τὸ γάλα, ἐπὶ

τὸν ἥλιον, ἐνοπτρον γινόμενον τῇ ὀψει τῷ ἀπὸ τοῦ ἡλίου ὑπ' αὐτῆς ὁρμμένῳ φωτί, ὡς ἔλεγον οἱ περὶ Ἱπποκράτην καὶ τὸν κομήτην γίνεσθαι. τρίτην δὲ δόξαν εἴρηκε ταύτην εἶναι, καίτοι τετάρτης μνημονεύσας, ἥτοι εἰς μίαν συνάγων τὰς τῶν Πυθαγορικῶν, οἱ ὁδὸν μὲν ἔλεγον τὸ γάλα, ἀλλ' οἱ μὲν τοῦ ἡλίου οἱ δὲ ἄστρου τινὸς τῶν ἐκπεσόντων ἐκ τοῦ οὐρανοῦ κατὰ τὴν ἐπὶ Φαέθοντος φθοράν, ἡ ταύτην τὴν δόξαν ὡς τέλεον κενὴν τε καὶ μυθώδη παραιτούμενος. **Olympiodorus in Mete.** 66.7–68.34 τῶν δὲ περὶ γαλαξίου ψευδῶν δοξῶν τεσσάρων οὐσῶν δύο Πυθαγόρειοι εἰσι (cf. §2–3), τῶν δὲ ἄλλων ἡ μὲν Ἀναξαγόρειός ἐστιν (cf. §7), ἡ δὲ λοιπὴ Ἱπποκράτειος (cf. §4). ἔστι δὲ ἡ πρώτη τοιαύτη (cf. §2)· Φαέθων, φησὶν, ὁ ἀπὸ Ἥλιου καὶ Κλυμένης ἦτησε τὸν ἴδιον (67) πατέρα παραδοῦναι αὐτῷ τὸ ἄρμα, ἐφ' ᾧ ἠνιοχεῖται. ἐπέστη, ἔδωκεν, ἔλαβεν, ἀτεχνῶς ἤλασεν, ἐλάσας κατέφλεξε, καὶ ὁ τόπος ἐκεῖνος ὁ καταφλεχθεὶς ἐστὶν ὁ γαλαξίας. ἀλλ' ἐπειδὴ μυθῶδες τὸ λεγόμενον, ἄτοπον δὲ μυθώδη ταῦτα νομίζειν Πυθαγορείου τῆς δόξης καθεστηκυίας, φέρε ταύτην ἀλληγορήσωμεν κτλ. ... αὕτη πρώτη Πυθαγόρειος δόξα. ταύτης ὡς μυθώδους παρασιωπᾷ ὁ Ἀριστοτέλης τὸν ἔλεγχον· τὸ γὰρ καταδήλως ἐλεγχόμενον περιττὸν εἰς ἐξέτασιν προφέρεσθαι, διὸ καὶ μόνας τρεῖς ἐν τῷ πέρατι λέγει δόξας ὡς ἂν μὴδὲ λογισάμενος ταύτην. δευτέρα δόξα καὶ αὕτη Πυθαγόρειος οὖσα (cf. §3), ἔχει δὲ οὕτως· ὁ ἥλιός ποτε μὴ τὴν τοῦ ζωδιακοῦ καὶ κατὰ φύσιν ὁδὸν βαδίσας, ἀλλ' ἑτέραν ἀτραπὸν διανύσας ἐξέπύρρωσεν αὐτὴν καὶ ὥσπερ λεωφόρον ὁδὸν ὑπὸ ἀμάξης κατατριβείσαν εἰργάασατο, καὶ ἐκεῖνος ὁ τόπος ἐστὶν ὁ γαλαξίας ὀνομαζόμενος. ἀλλὰ, φησὶν, ἄτοπος ὑπόθεσις· κτλ. ... τρίτη δόξα Ἀναξαγόρου καὶ Δημοκρίτου (cf. §§7–8). οὗτοί φασι τὸν γαλαξίαν εἶναι τὸ ἴδιον φῶς τῶν ἀστέρων τῶν μὴ φωτιζομένων ὑπὸ τοῦ ἡλίου. ἔχουσι γάρ, φησί, τὰ ἄστρα τὸ ἴδιον φῶς καὶ ἐπὶ κτήν τὸ ἀπὸ τοῦ ἡλίου. καὶ δηλοῖ ἡ σελήνη. ταύτης γὰρ ἕτερον μὲν τὸ ἴδιον φῶς, ἕτερον δὲ τὸ ἀπὸ ἡλίου· τὸ γὰρ ἴδιον αὐτῆς φῶς ἀνθρακῶδες ἐστὶν, ὡς δηλοῖ ἡμῖν ἡ ἔλλειψις αὐτῆς. (68) ἀλλ' οὐ πάντα, φησί, τὸ ἐπὶ κτήν δέχονται· τὰ οὖν μὴ δεχόμενα ἐκεῖνα τὸν κύκλον τοῦ γαλαξίου ἀπεργάζονται. ἐλέγχει δὲ καὶ ταύτην τὴν δόξαν Ἀριστοτέλης κτλ. ... τετάρτη δόξα Ἱπποκράτους τοῦ Χίου (cf. §4). οὗτός φησι τὸν γαλαξίαν γίνεσθαι ἀνακλάσεως γενομένης πρὸς τὸν ἥλιον, ἀλλ' ἀνακλάσεως οὐκ ἀπὸ ἀτιμίδος, καθάπερ ἔφαμεν ἐπὶ τοῦ κομήτου, ἀλλ' ἀπὸ ἀστέρων. φέρεται οὖν, φησὶν, ἡ ὀψις πρὸς τοὺς ἀστέρας, καὶ ἐκεῖθεν ἀνακλάται πρὸς τὸν ἥλιον καὶ οὕτω φέρεται πρὸς ἡμᾶς. οὕτως ὁ Ἱπποκράτης. *in Mete.* 75.24–76.5 (refutation of Aristotle) ὁ δὲ μέγας Ἀμμόνιος διὰ ἰσαρίθμων ἐπιχειρημάτων ἀποδείκνυσιν, ὅτι οὐκ ἔστι πάθος ἀέρος (sc. ὁ γαλαξίας), καὶ ἔστι πρῶτον τὸ ἐκ τοῦ ἀναλλοιώτου. εἰ γὰρ πάθος ἦν ὁ γαλαξίας, ἔδει αὐτὸν ἀλλοίωσιν ἀναδέχεσθαι καὶ ἐν μὲν τῷ θέρει τυχόν διὰ τὸ εἶναι πλείονα τὴν καπνώδη ἀναθυμίασιν λαμπρότερον γίνεσθαι, ἐν δὲ τῷ χειμῶνι ἀμαυροῦσθαι. δεύτερον ἐπιχείρημα τὸ ἐκ τοῦ καθόλου. καθόλου γὰρ οὐδὲν τῶν γινομένων ἐκ πάθους ἀέρος ἐν δὴ κατ' ἀριθμὸν πάσῃ τῇ γῇ ὁράται· νῦν δ' ὁ γαλαξίας πᾶσι τοῖς ἐν τῇ γῇ ὁμοίως ὁράται. τρίτον ἐπιχείρημα ἐκ τῆς σελήνης. αὕτη γὰρ ὑποκάτω ἐστὶ τοῦ γαλαξίου, διότι αὕτῃ μὲν παραλλάττει. δείκνυται δὲ τοῦτο ἐν τῇ συντάξει Πτολεμαίῳ (*Alm.* 1, pp. 401–402), ὅτι τὰ μὲν παραλλάσσοντα κατωτέρω εἰσὶ, τὰ δὲ ἥττον ἀνωτέρω. τέταρτον ἐπιχείρημα ἐκ τῶν ὑπολοίπων πλανωμένων, ὅτι καὶ τούτων ἐπάνω τον ἐπιχείρημα ἐκ τῶν ὑπολοίπων πλανωμένων, ὅτι καὶ τούτων ἐπάνω ἐστὶν ὁ ζωδιακὸς ἐν αὐτῇ ὡν τῇ ἀπλανεῖ. εἰ γὰρ ἦν κατωτέρω τῆς ἀπλανοῦς, ἡνίκα ὑπερεῖχε τὸν Τοξότην καὶ Διδύμους, καθ' οὓς καὶ συμβάλλει (76) ὁ κύκλος

αὐτοῦ, νοθεύειν ἤμελλεν αὐτοῦ τὴν χροίαν, καὶ ὁμῶς λευκότερά ἐστι ταῦτα ὀράν. ἔστι δὲ καὶ ἔξωθεν προσευπορήσαι καὶ ἄλλο ἐπιχειρήμα, ὅτι εἰ ἦν πάθος τοῦ ἀέρος, ἔδει, καθὰ συμβάλλει τῷ Τοξότη καὶ Διδύμοις, ἐκεῖνα μὴδὲ ὅλως φαίνεσθαι· ἡ γὰρ οὐ δύναται πλησίον τῆς ὁδοῦ τοῦ ἡλίου συνίστασθαι, ὥς καὶ αὐτὸς ἔφη Ἀριστοτέλης. **John Philoponus in Mete.** 75.17–21 ἔστι δὲ τὰ περὶ ὧν διδάσκει νῦν οἱ τε κομῆται καὶ ὁ καλούμενος γαλαξίας κύκλος. ὅπερ δὲ τῷ φιλοσόφῳ ποιεῖν ἔθος ἐπὶ τῶν φυσικῶν ζητημάτων ἐκάστου, τοῦτο ποιεῖ καὶ νῦν τὰς τῶν παλαιοτέρων περὶ τοῦ προκειμένου δόξας προίστορων καὶ τὰς οὐ καλῶς ἐχούσας ἐλέγχων πρῶτον, εἶτα τὴν οἰκείαν περὶ τοῦ ζητουμένου διδάσκων ὑπόληψιν. *in Mete.* 114.31 ff. καὶ ἄλλως δὲ δεικνύειν εὐχερὲς ὥς οὐκ ἔστι τοῦ ἀέρος τὸ γάλα πάθος (κτλ.).

Chapter heading: Aristotle Mete. 1.1 338b22 περὶ τε γάλακτος. *Mete.* 1.3 339a34–35 λέγωμεν περὶ τε τῆς τοῦ γάλακτος φαντασίας. *Mete.* 1.8 346b13 περὶ τε ... τοῦ καλουμένου γάλακτος. **Eratosthenes Cat. Cat.** 44, p. 131.1 Pámias I Massana–Zucker Γαλαξίας. **Hipparchus in Arat.** 1.9.14 ἐν δὲ τοῖς ἐξῆς περὶ τοῦ γαλαξίου κύκλου εἰπὼν ἐπιφέρει (sc. Aratus) κτλ. **Alexander of Aphrodisias in Mete.** 37.2–3 προτίθεται μὲν περὶ τοῦ γαλαξίου κύκλου ποιήσασθαι τὸν λόγον, καλεῖ δ' αὐτὸν γάλα. **Macrobius in Somn.** 1.15.8 *haec de lacteo*. **John Philoponus in Mete.** 2.42–3.1 περὶ ... τοῦ καλουμένου γάλακτος. (Περὶ γάλακτος in medical writers pertains to milk.)

§1 Nominal definition: Aristotle Mete. 1.8 346a16–17 οὗτος δ' ὁ κύκλος ἐν ᾧ τὸ γάλα φαίνεται τοῖς ὁρώσιν. **Cicero Rep.** 6.16 (= *Somn. Scip.* 8) *illum incolunt locum, quem vides—erat autem is splendidissimo candore inter flammas circus elucens—quem vos, ut a Graiis accepistis, orbem lacteum nuncupatis*. **Geminus Elem.** 5.11 μόνος γὰρ ἐν τῷ κόσμῳ κύκλος ἐστὶ θεωρητὸς ὁ τοῦ γάλακτος, οἱ δὲ λοιποὶ λόγῳ εἰσὶ θεωρητοί. *Elem.* 5.68 λοξὸς δὲ ἐστὶ κύκλος καὶ ὁ τοῦ γάλακτος. ... συνέστηκε δὲ ἐκ βραχυμερίας νεφελοειδοῦς καὶ ἔστιν ἐν τῷ κόσμῳ μόνος θεωρητός. **Ovid Met.** 1.167–168 *est via sublimis, caelo manifesta sereno; / lactea nomen habet, candore notabilis ipso*. **Pliny Nat.** 18.280 *est praeterea in caelo qui vocatur lacteus circulus, etiam visu facilis*. **Martianus Capella** 8.826 *galaxias vero {lacteus} obliquorum multo maiore ambitu porrectus etiam visibus approbatur*. **Isidore of Seville Etym.** 3.46.1 *lacteus circulus via est, quae in sphaera videtur, a candore dicta, quia alba est*.

§2 Pythagoreans: Aristotle Mete. 1.8 345a13–16 τῶν μὲν οὖν καλουμένων Πυθαγορείων (58B37b, Oenopides 41.10 DK) φασὶ τινες ὁδὸν εἶναι ταύτην οἱ μὲν τῶν ἐκπεσόντων τινὸς ἀστέρων, κατὰ τὴν λεγομένην ἐπὶ Φαέθοντος φθοράν. **Lucretius DRN** 5.396–406 *ignis enim superavit et ambiens multa perussit, / avia cum Phaethonta rapax vis solis equorum / aethere raptavit toto terrasque per omnis. / at pater omnipotens ira tum percitus acri / magnanimum Phaethonta repenti fulminis ictu / deturbavit equis in terram, Solque cadenti / obviis aeternam suscepit lampada mundi / disiectosque redegit equos iunxitque tremantis, / inde suum per iter recreavit cuncta gubernans, / scilicet ut veteres Graium cecinere poëtae. / quod procul a vera nimis est ratione repulsum*. **Diodorus Siculus** 5.23.2 πολλοὶ ... τῶν τε ποιητῶν καὶ τῶν συγγραφέων φασὶ Φαέθοντα τὸν Ἥλιου μὲν υἷον, παῖδα δὲ τὴν ἡλικίαν ὄντα, πείσαι τὸν πατέρα μίαν ἡμέραν παραχω-

ρῆσαι τοῦ τεθρίππου· συγχωρηθέντος δ' αὐτῷ τούτου, τὸν μὲν Φαέθοντα ἐλαύνοντα τὸ τέθριππον μὴ δύνασθαι κρατεῖν τῶν ἡνίων, τοὺς δ' ἵππους καταφρονήσαντας τοῦ παιδὸς ἐξενεχθῆναι τοῦ συνήθους δρόμου, καὶ τὸ μὲν πρῶτον κατὰ τὸν οὐρανὸν πλανωμένους ἐκπυρῶσαι τοῦτον καὶ ποιῆσαι τὸν νῦν γαλαξίαν καλούμενον κύκλον κτλ. **John Philoponus in Mete.** 101.25–32 τὸ μὲν οὖν κατὰ τὸν Φαέθοντα πλάσμα πολλοῦ διαβεβόηται τῆς ποιήσεως, ὡς νέος ὢν καὶ τοῦ πατρὸς Ἥλιου τὸ ἄρμα διφρηλατεῖν ἐπιθυμήσας οὗτος καὶ τυχὼν τούτου νεανικώτερον ἢ σοφώτερον ἐλαύνων οὐδὲ νόφ κατὰ τὸν ποιητὴν (*Od.* 6.320) ἐπιβάλλων ἰμάσθλην πολὺ τοῦ κόσμου μέρος κατέφλεξεν· ὦν καὶ ἡ διακεκαυμένη ζώνη ἐστὶ καὶ κατὰ τοὺς Πυθαγορείους (—) ὁ γαλαξίας ἐμφαίνων ἔτι νῦν χρώμα τῆς ἐκεῖθεν γενομένης πυρώσεως καὶ τῶν ἐνταῦθα πεσόντων ἀστέρων.

§3 Other Pythagoreans: Aristotle Mete. 1.8 345a16–18 (*Oenopides* 41.10 DK, cf. *Pythagorei* 58B.37b) οἱ δὲ τὸν ἥλιον τοῦτον τὸν κύκλον φέρεσθαι ποτέ φασιν· (§§2–3) οἷον οὖν διακεκαῦσθαι τὸν τόπον τοῦτον ἢ τι τοιοῦτον ἄλλο πεπονθέναι πάθος ὑπὸ τῆς φορᾶς αὐτῶν. **John Philoponus in Mete.** 101.32–34 ἔτεροι δὲ τῶν Πυθαγορείων (—) πάλιν τὸν ἥλιόν φασί ποτε τοῦτον ἐκπειριέναι κύκλον, οὐ τὸν ζῶδιακόν, ὃν νῦν δίδεισιν, ἀλλὰ τὸν τοῦ γάλακτος, ὅθεν ἐκπυρωθέντα τοῦτο ποιῆσαι τὸ χρώμα.

§4 Other Pythagoreans: Aristotle Mete. 1.8 345b9–12 (*Hippocrates of Chios* + *Aeschylus* 42.6 DK) ἔτι δ' ἐστὶν τρίτη τις ὑπόληψις περὶ αὐτοῦ· λέγουσιν γάρ τινες ἀνάκλασιν εἶναι τὸ γάλα τῆς ἡμετέρας ὄψεως πρὸς τὸν ἥλιον, ὥσπερ καὶ τὸν ἀστέρα τὸν κομήτην. **Diogenes Laertius VP.** 7.133 (*Stoics*) τίς ἡ αἰτία τῆς κατοπτρικῆς φαντασίας.

§5 again other anonymi: Beda venerabilis de Nat. 18 *lacteus circulus est figura candidior per medium caeli verticem, quem vulgo dicunt ex splendore solis in eo currentis ita fulgere.*

§6 Parmenides: Parmenides 28B8.55–59 DK τάντ' αἶ δ' ἐκρίναντο δέμας καὶ σήματ' ἔθεντο / χωρὶς ἀπ' ἀλλήλων, τῇ μὲν φλογὸς αἰθέριον πῦρ, / ἥπιον ὃν, μέγ' ἀραιὸν {ἐλαφρόν}, ἐωυτῶι πάντοσε τωῦτόν, / τῶι δ' ἑτέρωι μὴ τωῦτόν· ἀτὰρ κάκεινο κατ' αὐτό / τάντ' αἶ νύκτ' ἀδαῇ, πυκινὸν δέμας ἐμβριθές τε. 28B11.1–4 DK πῶς ... (2) ... γάλα τ' οὐράνιον ... / (3) ... ὠρμήθησαν / γίγνεσθαι.

§§7–8 Anaxagoras Democritus: Aristotle Mete. 1.8 345a25–31 οἱ δὲ περὶ Ἀναξαγόραν (59A80 DK) καὶ Δημόκριτον (cf. 68A91 DK) φῶς εἶναι τὸ γάλα λέγουσιν ἄστρον τινῶν· τὸν γὰρ ἥλιον ὑπὸ τὴν γῆν φερόμενον οὐχ ὁρᾶν ἔνια τῶν ἄστρον. ὅσα μὲν οὖν περιορᾶται ὑπ' αὐτοῦ, τούτων μὲν οὐ φαίνεσθαι τὸ φῶς (κωλύεσθαι γὰρ ὑπὸ τῶν τοῦ ἡλίου ἀκτίνων)· ὅσοις δ' ἀντιφράττει ἡ γῆ ὥστε μὴ ὁρᾶσθαι ὑπὸ τοῦ ἡλίου, τὸ τούτων οἰκεῖον φῶς εἶναι φασὶ τὸ γάλα.

§7 Anaxagoras: Aristotle Mete. 1.8 346b5–6 ἔστιν τὸ γάλα, ὡς εἰπεῖν οἷον ὀριζόμενον, ἢ τοῦ μεγίστου διὰ τὴν ἑκκρισιν κύκλου κόμη.

§8 Democritus: Damascius at John Philoponus in Mete. 118.9–10 (perhaps quoting *Heraclides Ponticus*) εἶναι γάρ φησι τὸν γαλαξίαν τοῦ οὐρανοῦ τινα διάθεσιν ἄφθαρτον, ἀστρώων, μικρῶν ἀστέρων πυκνότητι γαλακτίζουσιν. cf. *Thucydides* 2.28.

§9 Aristotle: Aristotle Mete. 1.7 344a8–10 ὑπόκειται γὰρ ἡμῖν τοῦ κόσμου τοῦ περὶ τὴν γῆν, ὅσον ὑπὸ τὴν ἐγκύκλιόν ἐστιν φοράν, εἶναι τὸ πρῶτον μέρος ἀναθυ-

μίαςιν ξηράν καὶ θερμήν. *Mete.* 1.8 346b1–6 ὥστ' εἴπερ καὶ περὶ τοῦ φαίνεσθαι κομήτας ἀποδεχόμεθα τὴν αἰτίαν ὡς εἰρημένην μετρίως, καὶ περὶ τοῦ γάλακτος τὸν αὐτὸν ὑποληπτέον τρόπον ἔχειν· ὁ γὰρ ἐκεῖ περὶ ἓνα ἐστὶν πάθος ἡ κόμη, τοῦτο περὶ κύκλον τινὰ συμβαίνει γίγνεσθαι τὸ αὐτό, καὶ ἔστιν τὸ γάλα, ὡς εἰπεῖν οἶον ὀριζόμενον, ἢ τοῦ μεγίστου διὰ τὴν ἔκκρισιν κύκλου κόμη. **Alexander of Aphrodisias** in *Mete.* 41.14–17 ἀλλὰ καὶ τὸ γάλα ὁμοία τις ἀναθυμίασις τῇ κόμῃ. ὁ γὰρ ἐπ' ἐκείνων ἢ περὶ ἓν ἄστρον ἀναθυμίασις τοιαύτη γενομένη κομήτην ποιεῖ, τοῦτο περὶ τοὺς ἀστέρας ἅμα γενόμενον τοὺς καθ' ὃ τὸ γάλα φαίνεται τὸν καλούμενον ποιεῖ γαλαξίαν κύκλον.

§10 *Stoics: ps.Galen Qual.Incorp.* 19.478.1–2 K., p. 13.14–15 Westenberger (*SVF* 2.327) τὸ αἰθέριον δὴ ἐκεῖνο πῦρ, ὃ φ' οἷ φασὶ τὰ τε στοιχεῖα καὶ τὸν κόσμον γεγονέναι.

Commentary

A Witnesses

The number of witnesses for this chapter is similar to those for the previous chapter 3.1. They preserve the contents of the chapter well. Both witnesses preserve the same twelve lemmata in the same order. S appears to have written out the chapter in full, and P to have refrained from abridging it.

(1) The tradition of P is represented by P^B, P^G, P^Q and P^{Ps} (the last for the heading only). Ps.Galen leaves out a block of three doxai (§§6–8). Psellus includes several headings from the meteorological section of the *Placita* in his *De omnifaria doctrina* and elsewhere, but the contents of the chapters derive from elsewhere.

(2) The chapter in S combines the first sentence of the Aristotle lemma with a short excerpt from AD, a type of coalescence found more often in the *Anthology*, see Diels *DG* 75 n. 2, M–R 1.249–254, and Jeremiah at M–R 4.286 and 352.

(3) T does not make use of any material from Book 3.

B Proximate Tradition and Sources

(1) *Proximate tradition.* There are parallels in ps.Aristotle *De mundo*, the quite substantial physical fragments of Arrian, and several noteworthy general and

individual parallels in Seneca *Naturales quaestiones* Book 7. A remarkable collection of meteorological doxai is found in various passages in the late historian Ammianus Marcellinus. The *Metarsiology* of Theophrastus(?) lacks one or more chapters on meteors and comets, just as it lacks one on the Milky Way (see above, ch. 3.1 at Commentary B), and one on the rainbow (see below ch. 3.5 at Commentary B).

(2) *Sources*. §§1–3 derive from Aristotle's dialectical overview, *Mete.* 1.6, while §4 summarizes Aristotle's own view at *Mete.* 1.7. We do not know from what sources the other lemmata derive.

C Chapter Heading

It is of the umbrella type (περί τοῦ δεινῶ) that dominates in the *Placita*, see above, ch. 1.3 Commentary C. The umbrella here (like that of the next two chapters) covers a number of different phenomena collected in a single chapter rather than distributed over several. The most important question type/category is that of essence/substance; that of cause (διὰ τῆς) also plays a part, and the categories of place and quality are of secondary interest.

P^{BQ} has a long heading including 'beams' (δοκίδες). The shorter headings of G and S are presumably due to the abridgment that is habitual with these authors, while the headings of P^Ps are formulated rather freely (but it should be noted that δοκίδες are mentioned at the beginning of c. 140). In view of the fact that the 'beams' are only mentioned explicitly in §6 as part of a list, one might be tempted to conclude that the shorter version has more chance of being originally A's. One wonders what would have motivated the heading's purported extension in P. Because of these uncertainties we retain the longer heading.

D Analysis

a Context

For the explanation of A's order in general see above, Book 3.prooem., at Commentary D(a). Just like the previous chapter this one too is related to its predecessors in Aristotle's treatise. But as we have seen the order of treatment in the *Placita* is not the same as in the *Meteorology*. Aristotle discusses shooting stars and similar phenomena at *Mete.* 1.4–5, continuing with comets in *Mete.* 1.6–7, while A in this chapter begins with comets and has the shooting stars come second. And Aristotle deals with the comets before the Milky Way, while A begins with the Milky Way. The next chapter, 4.3, is about lightning and similar phenomena, which are treated in Aristotle as far away as *Mete.* 2.9–3.1. In Seneca's *Naturales quaestiones* comets and shooting stars respectively are treated in two different books, viz. *Nat.* 7 (sixth in the original order) and *Nat.* 1

(seventh in the original order), so at least after one the other as in A, contrasting with the order in Aristotle.

For the explanation of A's order in general see above Book 3.prooem., at Commentary D(a).

b Number–Order of Lemmata

P^B, confirmed by P^Q, has twelve lemmata, and S has twelve lemmata too, the same as P^{BQ} and in the same order. P^G has nine lemmata, leaving out §§6–8 in the middle. As the lemmata order is the same in all witnesses, this has to be preserved unchanged. Accordingly our order is the same as that of Diels in the *DG*. We have however augmented the number of lemmata by splitting up Diels' first lemma into two separate ones for the sake of convenience, thus getting §§1–2.

c Rationale–Structure of Chapter

Broadly speaking the chapter falls into two parts, the first, §§1–9 dealing with comets, the second, §§10–11, with shooting stars. But §6 also makes reference to a list of other phenomena similar to comets qua atmospherical phenomena, viz. 'bearded star, halo, beam, pillar etc.', while the final lemma, §12, refers to all these phenomena together, including (by implication) comets.

The main diaphonia of the first part is between comets as being real (§1: a star, §3: two stars or even more, §4: a structure, *σύστασις*, §7: a compound of pneuma and earth, and §9: stars again) as opposed to comets as phenomenal or illusory (§2: reflection of vision and §8: appearance of ignited air). It includes two compromise views in a block of two lemmata, §5: light trapped in a dense cloud, and §6: high clouds illuminated by lights high in the sky. These are compromise views, because the phenomena involved fit a qualification formulated further down in Book 3, namely at A 3.6.1: they are a mix of substance and appearance, because what is seen is clouds (and clouds are real), but not according to their own colour but with a different colour seen in the manner of a reflection (*μίξει τῆς ὑποστάσεως καὶ ἐμφάσεως ὑπάρχει, τῶν μὲν νεφῶν ὁρωμένων, οὐ κατ' οἰκείον δὲ χρῶμα, ἀλλ' ἕτερον ὅπερ κατ' ἔμφασιν φαίνεται*). Furthermore, within one horn of the diaphonia, that of reality, there is a sub-diaeresis between stars (§1, §3 and §9) and atmospherical phenomena, or quasi-phenomena (the block of §§4–7).

We also note the role explicitly played by clouds in three lemmata: §5, §6 and §12. In §5 we meet the comet in the guise of the light of a star enclosed in a cloud, whereas in §6 a comet, like other similar phenomena, is (just) a high cloud that has been illuminated from above. §2 does not mention clouds, but presumably the reflection as through a mirror of our vision to the sun can only happen via a cloud. In the previous chapter, 3.1.4, such a cloud may be believed

to be involved in the appearance of the Milky Way qua optical phenomenon, and this earlier lemma in fact refers forward to §§5–6 of our present chapter and to ch. 3.5, the role of clouds in the production of the rainbow. Finally, in §12 we have Xenophanes' ignited clouds, familiar from the cosmological chapters in Book 2 where his suns, moon and stars are all said to consist of ignited clouds (see *Loci Aetiani* §12). This time comets, shooting stars and other similar phenomena are regarded as combinations or movements (for the latter think of shooting stars) of such clouds. The combinations or gatherings of clouds recall the combined little stars of Democritus, but this is by the way.

Compare the useful headings in Gundel (1922) 1164–1170: comets as (1) 'Erzeugnis der Atmosphäre rein meteorologischer Natur'; (2) as 'beleuchtete Wolken'; (3) as 'Vereinigung verschiedener Sterne'; and (4) as 'Weltkörper mit bestimmten Umlaufszeiten'.

The organization of the first section of the first part of the chapter resembles that of its predecessor at ch. 3.1: §§1–2 a diaphonia of (purported Pythagorean?) views to begin with, this time however followed immediately by a lemma for Anaxagoras and Democritus at §3 (no interpolated Metrodorus and Parmenides as in ch. 3.1.4–5). §§1–3 derive from Aristotle *Mete.* 1.6 342b25–343a20. But Aristotle begins with Anaxagoras and Democritus (corresponding to §3), continues with the Pythagoreans (corresponding to §1), and as a third view cites that of (the mathematician) Hippocrates of Chios and his pupil Aeschylus (corresponding to §2). This modification of the sequence seems in the first place to be inspired by the conviction that the 'others' of §2 (in Aristotle Hippocrates and Aeschylus) are Pythagoreans, just as the related 'some people' at A 3.1.4 and the bearers of the name-label in §1.

As a consequence the diaphonia between §1 and §2 mirrors that between the lemmata at ch. 3.1.2–3 and 3.1.4. This first diaphonia, as in the previous chapter, is between reality (the comet qua star) and optical phenomenon (the comet qua the result of the reflection of the visual rays). A similar diaphonia occurs further down, in a bilemmatic block at the end of the presentation of the doxai dealing with comets, viz. between §9: the comet as the 'appearance' (φαντασία) of air that has been ignited, over against §10: comets as stars (as in §1). This produces a ring-compositional effect between end and beginning, not unlike the one we discerned in the previous chapter, 3.1.

Nevertheless the structure of our chapter is not entirely satisfactory, just as in the case of the previous one. This time, too, the sequence of lemmata at the beginning (§§1–3), not so good from a diaeretical point of view, is to be explained as the result of a restructuring of the Aristotelian matrix, which nevertheless continues to be present. We note an unsystematic series of elemental substances or combinations thereof in various locations: §4 red-hot dry vapour

from the earth, §5 light in dense cloud, §6 high cloud illuminated by light, §7 ignited blend of air and earth, §8 inflamed air. Atmospheric phenomena are complicated. Arranging this series in a diaeretically correct and worthwhile succession was perhaps too great a challenge.

d Further Comments

General Points

Epicurus mentions these phenomena at some length in his *Letter to Pythocles* (see below section E(b) General texts). But this material is absent in the present chapter, perhaps because his multiple solutions are adequately represented by other doxai. In the meteorological section he first appears in ch. 3.4 below, though not with a multiplicity of doxai. For the complicated role of Epicurus in the *Placita* see Runia (2018) at M–R 4.

Individual Points

Chapter heading ‘Beams’ are a kind of meteor. For ‘rods’, another kind of meteor or another name for the same kind, see below, ch. 3.6.

§2 For Hippocrates of Chius and Aeschylus see above, ch. 3.1.4 Commentary D(d)§4.

§11 We have included the words ὥς βέλος preserved by P^G, because they explain the violence of the immission.

§12 κινήματα] i.e. νέφη κινούμενα, e.g. διαίττοντες according to DK ad loc.

e Other Evidence

The whole of Seneca *Naturales quaestiones* Book 7 (Book 6 according to the original order) is about comets. But unlike Aristotle and his tradition, to which A belongs as well, Seneca posits that comets are not atmospheric but celestial phenomena. This point of view is also that of Pliny, *Nat.* 2.94. Such shared views used to be regarded as derived from Posidonius, and are still so attributed by Theiler. Because of its irregular behaviour a comet could not be a heavenly body consisting of aether in Aristotle’s system. For Seneca this behaviour was not an impediment in view of the homogeneity of nature: the stars, too, consist of fire.

For an English translation of the Aëtian text see Volume 5.4

Commentary

A Witnesses

The witnesses are both P, represented by P^B, P^G and P^Q, and S. P has 5 and S 15 lemmata, so P has considerably abridged the chapter, going even so far as to reduce §§13–14 to a single lemma by leaving out the name-label Strato and the first part of the text of §14.

Such false coalescences happened more often, see already Diels *DG* 64. To cite some instances: something similar has occurred at ch. 1.20.1–2, where P,

eliminating the Epicurus lemma extant in A at S 1.18.4a, simply added its name-label Epicurus to the lemma with name-label 'Zeno and his followers' (thus S 1.18.1d), replaced A's formula with the simpler name-label 'the Stoics', and consequently attributed a Stoic doctrine to Epicurus as well, though in reality Epicurus' view is the opposite to that of the Stoics. In A 4.13.12–13 Histiaeus' doxa has been coalesced in P with the name-label Empedocles from another lemma that has been left out. Also compare A at P 4.7.1–2, where the name-label Heraclitus, attested by T, has been eliminated in what originally was the second lemma, and a Pythagoreanizing and Platonizing new lemma is created through coalescence. An interesting case is found in only a part of P's tradition for ch. 4.23, where a new lemma has been produced by haplography (see at ch. 4.23, Commentary D(d)§§1–2). On P's procedure in the present chapter see also our analysis at M–R 1.188.

G this time abstracted all of P's 5 lemmata from a text in which the false coalescence had already taken place.

S appears to have written out the chapter in full. The lemmata order is the same in P and S, with an exception at the end for the order Stoics/Aristotle (+ Strato) in P 4/5a/5b as opposed to Aristotle/Strato/Stoics in S 13/14/15, see below section D(b).

As we have noted T does not make use of any material from Book 3.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The proximate tradition is for the most part limited to generalities and anonymous doxai. Worthwhile individual accounts are extant in Seneca's *Naturales quaestiones* Book 8 (Book 2 according to the original order), which deals with lightning and thunder, and at Lucretius *DRN* 6.96–450. From Theophrastus(?) *Metarsiology* (for this treatise see Introduction to Book 3, section 6) we must cite, as providing parallel evidence the following chapters, citing Daiber's headings (quoted below under section E(b)): *Metars.* [1.] *The account of the causes of thunder*; [2.] *The account of the causes of lightning*; [3.] *The account of the causes of thunder occurring without lightning*; [4.] *The account of the causes of lightning occurring without thunder*; [5.] *The account of the reasons why lightning precedes thunder*; and [6.] *The account of the causes of thunderbolts*. In this treatise the firewind is not treated together with thunder and lightning, but this occurs in the last section of ch. [13.], *The account of the causes of different winds*, at lines (43)–(54). We note that the same holds for Seneca's Book on winds, where the *turbo* and its stronger variety, the firewind, are discussed near the end, at *Nat.* 5.13.

(2) *Sources.* Plato's *Timaeus* is silent on these subjects (see Solmsen 1960, 416). Two chapters in Aristotle's *Meteorology*, 2.9–3.1 are the ultimate inspiration for a systematic treatment of the issues our chapter is concerned with.

C Chapter Heading

Again of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C). The umbrella here (like that of the previous chapter and the next) shelters a number of different phenomena collected in a single chapter rather than distributed over several, as in the *Metarsiology* attributed *disertis verbis* to Theophrastus. The most important question type/category is that of essence/substance, that of cause (διὰ τί) also plays a part, and the sub-question *unde* and the categories of place, quality and action and passion are involved as well. It is virtually identical in P^{BQ} and S, shorter in P^G. It adequately lists and sums up the various phenomena treated in the chapter, which can be amply paralleled in headings or heading-like phrases in both the proximate and the wider tradition. Thunder (sometimes represented not by its name but by its audible effect) is the first, lightning (sometimes represented not by its name but by its visual effect) the second phenomenon in the heading, and also in the majority of the lemmata. §6 mentions only lightning, §10 only thunder, but only §12 has lightning first and thunder second. The other phenomena occur in those lemmata where they do occur in the order in which they are cited in the heading.

Gregory (2013) 42–48 combines the heading with §1 (name-label Anaximander), and argues that the resulting combination derives from the Milesian and should be seen as important testimony. As to the heading itself, he claims that ‘this is an odd collection of phenomena for a doxographer to bring together in one heading especially as typical headings in ps.-Plutarch and Stobaeus are brief’. But as we know by no means all headings in P and S are brief, and both the preceding chapter, ch. 3.2 (3 items in the heading), and the next, ch. 3.4 (no less than 7 items in the heading)—not cited by Gregory—contain similar collections of related meteorological phenomena. But then Aristotle’s announcement of his treatment of all five subjects mentioned in the embedded heading of ch. 3.3 at *Mete.* 2.9 369a10–12 should also have been derived by him from Anaximander, because it would be an equally odd and also unusually long list for Aristotle. This passage is cited below at section E(b) Chapter heading, together with a few excellent Aristotelian parallels (one even with three specified items and an unspecified number of others of the same kind, derived from the list of subjects already treated and still to be treated in the proem at *Mete.* 1.1 339a3–5). Moreover, Wilson (2013) 76–77 with nn. 6–7 and 227–235, argues that this collection of ‘violent atmospheric phenomena: thunder, lightning, hurricanes, whirlwinds, firewinds and thunderbolts’ is the seventh of the ten groups into which Aristotle divides the phenomena studied and explained in the *Meteorologica*, and shows that this classification and ordering depend on his specific and original meteorological physics.

What we have in our chapter is of course an instance of the reverberations of Aristotelian embedded headings found throughout the *Placita*, cf. e.g. ch. 3.1 with *Mete.* 1.8 345a11–13, ch. 3.4 with 2.12 349a9–11. As a reference ('eorum fit mentio quae proxime vel antecedunt vel sequuntur', Bonitz 95b33) such an Aristotelian formula is the predecessor or equivalent of a heading, or title, see M–R 2.1.48, 159–161, 162–163, 170, 202–204.

Gregory's suggestion that Anaximander may have targeted passages in Homer and above all Hesiod (esp. *Theog.* 845–846) is irrelevant.

D Analysis

a Context

For the explanation of A's order in general see above, A Book 3.prooem. at Commentary D(a). The present chapter is concerned with phenomena mainly connected with fire and *pneuma*, the next (3.4) with phenomena mainly connected with air and water. It follows upon ch. 3.2 on comets and precedes ch. 3.4 on clouds. In Aristotle's *Meteorology* the chapters parallel in contents to ch. 3.3 on thunder and lightning etc. (viz. the mini-treatise 2.9–3 1, which now rather awkwardly spans two Books), following upon the treatment of earthquakes (*Mete.* 2.7–8 corresponding to ch. 3.15) and preceding that of haloes and rainbows (*Mete.* 3.2–5 corresponding to the brief ch. 3.16 plus the long ch. 3.5), are located at quite a distance from the chapters of which the contents correspond to chs. 3.1–2 (see ad loc.). A's arrangement may be compared with the sequence in Seneca's *Naturales quaestiones*, where the Book on lightning and thunder, the final Book according to the original order (Book 8 = Book 2 in the disturbed order), follows upon Book 7 in the disturbed order = originally Book 1, which is about comets. Both chapters are near the beginning in A, while the two books in Seneca's original order are actually the first ones. For the parallelism of the themes of chs. 3.3–7 + 14–15 + 4.1 with Lucretius' series at *DRN* 6.96–737 see Ernout–Robin (1928) 3.253–254 and Runia (1997) 97, reprinted at M–R 3.260, and for details in the present chapter Ernout–Robin (1928) 3.199–208 (on thunder), 3.213–221 (on lightning, 'éclair', *fulguratio*, ἀστραπή), 3.224–235 (on thunderbolt, 'foudre', *fulmen*, κεραυνός), and 3.247–252 (on *pres-teres*, πρηστήρες, translated 'trombes').

b Number–Order of Lemmata

P^B, confirmed by P^Q and P^G, at a first glance has five lemmata, while S has fifteen lemmata. Comparison of P^{5a}–b with S¹³–14 reveals that P, omitting the first lines of §14 including the name-label Strato, has coalesced the Aristotle-plus-Strato lemmata, as Diels ad loc. already pointed out. The cause is either an unfortunate application of the technique of abridgement or a mechanical

accident in the tradition; for parallel cases see above section A. P's new lemma augments Aristotle's doxa with explicit views on the firewind and the *typhon*, not found in the original §13 (which only implicitly includes them in τὰ τοιαῦτα), so may have been constructed for a reason. Although P also omitted παρίστησι at the end of §13[53], homoioteleuton from ἀστραπήν in §13[53] to ἀστραπήν at §14[55] is unlikely because of the intervening words τάχει δὲ κεραιὸν at §14[55].

The order of the lemmata (taking into account those lacking in P) is the same in both witnesses, with the exception of P4 = S 15. That P interfered with the original order by putting its final lemma before §13 one can understand, because he replaced §12, the Chrysippus lemma, with §15, the Stoic lemma, demonstrating again that he prefers a more general name-label to an individual one, in the present case taking the doxa along as well. And he also coalesced the Aristotle and Strato lemmata, placing this new lemma in the final position. Diels in the *DG* more or less mechanically adopted P's modified order, but we feel justified in following that of S.

c Rationale–Structure of Chapter

Thunder (sometimes represented by what we hear) comes first in the majority of lemmata and clearly is the major phenomenon requiring an explanation. Lightning (sometimes represented by what we see) is a sort of epiphenomenon, ensuing when clouds produce thunder when they are bursting on being invaded by *pneuma* or a hotter element, such as aether or the hot exhalation, or are struck by winds, or collide, etc. The thunderbolt is mentioned in §3, §4, §7, §11, §12, §14 and §15, so in only seven out of fifteen lemmata. The firewind occurs in §3, §4, §9, §11, §12, §14 and §15, so also in only seven out of fifteen. The *typhon* occurs in §4, §12 and §14, so in only three out of fifteen. Constructing a diaeresis on the basis of these numerical differences as to the presence in lemmata of the five phenomena is impossible.

What is rather remarkable, in view of the preference of the *Placita* for arrangement according to doxa rather than chronology or affiliation (though these too play a part, see M–R 2.73–96 and passim, also Jeremiah (2018) at M–R 4.310–319), is that here we do have examples of both these alternative principles of organization. The first two lemmata, §§1–2, present the early Milesians Anaximenes and Anaximander. Metrodorus is at §3 for another reason (see below), but §§4–5 continue with the Ionian Succession by presenting Anaxagoras and (his follower) Archelaus, another duo. Xenophanes at §6 may represent the Pythagorean (or Italic) Succession to which also Empedocles at §7 may be assumed to belong. Skipping §§8 and §9, Diogenes and Heraclitus, we arrive at §§10–11, presenting the Presocratic Atomists Leucippus and

Democritus in chronological order. Note that all these eleven figures are Presocratic philosophers (so-called). Post-Socratic philosophy is represented at the end of the chapter by only four lemmata out of fifteen. Chrysippus and the Stoics (both listed because of some theoretical differences) at §12 and §15 come before and after the Peripatetics Aristotle and Strato, another duo in chronological order. Plato and Epicurus are conspicuously absent. A similar mixed organization can be observed in chs. 1.3 and 1.7.

A's diaeresis is for the most part based on differences in the explanation of the cause of thunder by the interaction of external factors and clouds, on a gliding scale. In §§1–3 *pneuma* interfering with clouds is at issue, which explains how Metrodorus in §3 comes to be grouped with Anaximander and Anaximenes. Moreover *pneuma* falling upon a frozen cloud (εἰς νέφος πεπηγὸς ... ἐμπέσῃ πνεύμα) preludes upon the conflict between hot and cold in §§4–5. In §§4–5 the cause is the hot falling upon the cold, which Archelaus is said to have illustrated with an example from our ordinary experience (hot stones plunged into cold water). §§6–7 are about the effects of light on clouds, with §7 Xenophanes exceptionally explaining only lightning, while Empedocles explains thunder as the effect of 'light falling upon a cloud' (ἐμπτωσιν φωτὸς εἰς νέφος). §8 Diogenes is aptly joined with §7 Empedocles because he mentions 'fire falling upon a cloud' (ἐμπτωσιν πυρὸς εἰς νέφος)—note the similar expression. Among the causes mentioned in §9 Heraclitus we next find 'fallings of *pneumata* upon the clouds' (ἐμπτώσεις πνευμάτων εἰς τὰ νέφη). Thus, a series of impacting substances consisting of light–fire–*pneumata* in what seems a descending scale corresponding to their location, in principle, in the cosmos. §§10–11, Leucippus and Democritus, do not speak of a 'falling upon' (ἐμπωσις, impact) of fire or whatever upon clouds, but, on the contrary, of a 'falling from' (emission) or 'being forced out of a cloud' of 'fire' (πυρὸς ... ἔκπτωσιν), or of a peculiar atomic 'compound of uneven composition' (συγκρίματος ἀνωμάλου ... ἐκβιαζομένου). Force is also involved in Democritus' explanation of the thunderbolt (ἡ φορὰ βιάσεται).

In the four lemmata that follow the explanations resemble those of the preceding lemmata in various ways, but there are also important differences. §12 Chrysippus explains lightning plus thunder as the effect of clouds being 'rubbed and ruptured by *pneuma*' (νεφῶν ἐκτριβομένων ἢ ῥηγνυμένων ὑπὸ πνεύματος), which comes close to saying that this *pneuma* forces its way out. And a little later he indeed speaks in these same terms when explaining the 'movement of the *pneuma*' (ἡ τοῦ πνεύματος φορὰ) that causes the thunderbolt, and its 'falling out' (ὅταν ... ἐκπέσῃ τὸ πνεῦμα) that causes the firewind. This *pneuma* is warmer (when producing the thunderbolt) than in the case of thunder plus lightning, or less warm than in the case of the thunderbolt (when pro-

ducing the firewind). §13 Aristotle of course avails himself of the famous hot and dry exhalation, which when encountering the wet—and also colder—exhalation (compare Archelaus in §5) produces all these phenomena by ‘forcing its way out’ (παραβιάζεται ... τὴν ἔξοδον), just as Democritus’ compounds in §11 are doing. §14 Strato likewise speaks of a conflict between hot and cold and of emission, the hot giving in and being forced out (ἐκβιασθῆν), of the cloud presumably. §15 the Stoics is aptly placed in the ultimate position because, exceptionally, no external factors are mentioned, the phenomena being produced by the clouds themselves as they collide and rub against each other.

d Further Comments

General Points

It is not clear what phenomena are meant by the terms *prester* and *typhon*. Possible renderings are whirlwind, hurricane, water-spout and firewind. We have used ‘firewind’ throughout for *prester*, because the word shows that the phenomenon is ‘burning’; one thinks of the scirocco. For options see Taub (2003) 177 n. 28, Bakker (2016) 120–121, 133.

The absence of detailed parallels elsewhere in A for the individual lemmata is noteworthy. The prologue of the *Placita* lists lightning etc. *disertis verbis* with other phenomena that fall within the scope of natural philosophy, so highlights their importance, no doubt also for traditional reasons (when we are aware of their rational explanation we need not worry about divine intervention).

Individual Points

§2 & §5 παρατιθείς: appeals to common experience are a feature of meteorological theorizing; numerous examples in Aristotle’s *Meteorology*, Theophrastus’(?) *Metarsiology*, Epicurus *Ad Pythoclem*, and Lucretius.

§3 Heat acquired by a moving object may be attributed to its movement alone. Here the movement enables the wind to gather hot particles of solar origin.

§§10–11 Leucippus and (generously) Democritus are present, but Epicurus is absent, perhaps because his multiple solutions are adequately represented by other doxai collected in the present chapter.

§13 Ideler’s comment (1836) 2. 251 on the parallel AD fragment, which he quotes in full omitting only the final colon, is very much worth quoting: ‘Quae Aristoteles hoc paragrapho ac sequentibus disseruit, succincte exposita reperiuntur apud eos, qui placita philosophorum composuerunt, velut apud Stobaeum *Eclog.* 1.30’ [= 1.29 Wachsmuth]. We also note that the ultimate source for this lemma is Arist. *Mete.* 2.9.

§15 Bollack (1978) 492 has not seen that the lemma is extant at S 1.29.1, p. 234.1–3.

e Other Evidence

The parallel accounts in widely scattered proximate sources such as Lucretius, Seneca (who cites some little known authorities by name), Pliny, Arrian and the *Scholia on Aratus* show that a rich intermediate tradition must have been available that dealt with these topics (for which Theiler still made Posidonius responsible). In Seneca *Naturales quaestiones* Book 8 (Book 2 according to the original order), which deals with lightning and thunder, the succession of *opinionēs* is rather different from that in A, though equally concerned with a relative chronology to which exceptions are allowed. (In *Nat.* Book 4.a, on the Nile, he begins *disertis verbis* with the views of the ancients: 2.17.2 *ab antiquissimis incipiam*). In *Nat.* Book 2 Thales is not first but second, as he is preceded by the *opinio* of Empedocles (whose name is not mentioned: *Nat.* 2.12.3, *quidam*). Anaxagoras and Aristotle follow (also at A 2.12.3). A second group consists of Anaximenes, Anaximander (in that order), Anaxagoras, and Diogenes (*Nat.* 2.17–20). A third group appears much later, at 2.54–56, viz. Posidonius, Clidemus and Heraclitus. For suggestions about this division into groups see Setaioli (1988) 386–398. We note that Seneca includes less doxai than A, but those of Clidemus and Posidonius are not present in A.

Robin at Ernout–Robin (1925–1928) 3.254, comparing A 3.3–4 with Lucretius *DRN* 6.451–494, meritoriously identifies Lucretius’ ‘modèle’ as ‘tel manuel doxographique’ which would have the same ‘origine prochaine’ as A (but the tradition he mentions is that of the Dielsian hypothesis with the questionable title: Theophrastus’ Φυσικῶν δόξαι via Posidonius).

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

The witnesses are P, represented by P^B, P^G, P^Q, and S, for these doxai extant only in S^L. P has three lemmata, S six, so at most P retained only half the chapter. P's lemmata are matched in S, and so is their order. Psellus is a witness to the heading and the contents in general, and so is Symeon Seth. The chapter of S treating of clouds etc. (1.31) in which he cites the present ch. 3.4 follows after the chapter (1.30) in which he cites A ch. 3.5, so here he has inverted the order of the Aëtian chapters. His lemmata form a continuous excerpt, so he again appears to have written out a chapter in full. His final lemma lacks the beginning including its name-label. And we have noted that T does not use any material from Book 3.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The proximate tradition is again for the most part limited to generalities and nameless doxai, but Seneca *Naturales quaestiones* Book 4B (originally Book 3) is more specific. For the parallelism of the themes of chs. 3.3–7 + 14–15 + 4.1 with Lucretius' series at *DRN* 6.96–737 see Runia (1997) 97.

(2) *Sources*. The subjects assembled here are treated systematically by Aristotle in no less than four chapters, *Mete.* 1.9–12. We may also cite (to use Daiber's headings) Theophrastus *Metarsiology* [c. 7] *The account of the causes of clouds*; [c. 8] *The account of the causes of different kinds of rain*; [c. 9] *The account of the causes of snow*; [c. 10] *The account of the causes of hail*; [c. 11] *The account of the causes of dew*; [c. 12] *The account of the causes of hoar-frost*. These texts are cited below under section E(b).

C Chapter Heading

The heading, of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), lists in S all of the seven phenomena that are at issue in various ways in the lemmata of the chapter. The umbrella here (like that of the two previous chapters) shelters a number of different phenomena collected in a single chapter rather than distributed over several, as in the *Metarsiology*. The most important question type/category is that of essence/substance, that of cause (διὰ τῆς) is also involved, while the question *unde* and the categories of place and quality occur as well. In the headings of P and its tradition several of these items are variously omitted. Most of its ingredients are anticipated in the embedded heading in Aristotle *Mete.* 1.12 349a9–11. Wilson (2013) 76–77 with nn. 6–7, and 146–155, argues that the 'condensations'—rain, snow, dew, frost, and hail—form the second of the ten groups into which Aristotle divided the meteorological phenomena; cf. above, ch. 3.3 Commentary C ad fin.

D Analysis

a Context

For the explanation of A's order in general see above, Introduction to Book 3, section 2, and also Book 3.prooem. at Commentary D(a). The present chapter is concerned with phenomena mainly connected with air and water, while the previous chapter (3.3) deals with phenomena mainly connected with fire and *pneuma*: we are nearing the earth. It comes before ch. 3.5, 'On the rainbow'. In Aristotle these subjects are discussed in a rather different order; ch. 3.3 may be placed alongside *Mete.* 2.9–3.1, ch. 3.4 alongside *Mete.* 1.9–12, while ch. 3.5 may be placed next to *Mete.* 3.2–5. In Seneca's *Naturales quaestiones* rainbows are treated in Book 1 (Book 7 according to the original order), lightning and thunder in Book 2 (Book 8 according to the original order), while clouds etc. are the subject of Book 4B (originally Book 3). So the order of A chs. 3.4 and 3.5 is the opposite of that of Seneca's Books 7 and 8, while the theme of the preceding ch. 3.3 is found at a considerable distance in Seneca's work.

b Number–Order of Lemmata

S has six lemmata, P^{BQ} and P^G three. In so far as these correspond they are in exactly the same order, which there is no reason to change and which is already that of Diels in the *DG*.

c Rationale–Structure of Chapter

The important term is ‘clouds’, νέφη, and the structure of the chapter depends on the differences among the stuffs from which these clouds are said to be formed. §1 Anaximenes and §2 Anaxagoras derive the clouds from air, §3 Metrodorus and §4 Xenophanes from something moist, or moisture, §5 Epicurus from atoms. But for §4 Xenophanes the hot, i.e. fire, also plays a part. We do seem to have a diaeretic list consisting of, in somewhat irregular succession, the terms air–moisture (i.e. water)–moisture (plus fire)—atoms. §4 Xenophanes is linked with the atoms of §5 because the freshwater part of the moisture has a fine-particled structure, is ‘fine-grained’. The mutilated final lemma cannot be integrated in this diaeresis.

What causes some surprise is that the role of the sun in bringing up moisture from the sea is attributed to Xenophanes in §4 only, although an evaporation of sorts is also attributed to Metrodorus in §3.

d Further Comments

General Points

The phenomena listed in the heading are far from equally represented in the lemmata, and in some cases not at all, presumably a sign of abridgement. Clouds (νέφη), the first and clearly most important item, occur in five out of six lemmata (not in §5). Nothing is said about ὀμίχλη, apart from §4[14] ὀμιχλούμενον. The rains (ὑετῶν) are paralleled *ad litteram* only in §5 ὑετόν, represented by ὄμβρους in §1, §4 and §6, and absent from §2 and §3. Dew (δρόσος) and hoar-frost (πάχνη) are entirely absent. Snow only occurs in §1 and §6, but hail is found four times, viz. in §1, §2, §5 and §6. Precipitation is mentioned four times: in §1 τὸ καταφερόμενον ὕδωρ, §2 πρὸς τὴν γῆν and ταῖς καταφοραῖς, §4 καταστᾶζειν, and §5 τῆς μακρᾶς καταφορᾶς, while evaporation is represented by §3 τῆς ὑδατώδους ἀναφορᾶς and §4 ἀνελκομένου ... τοῦ ὕγρου τὸ γλυκύ, so occurs twice. These processes are not mentioned together in any of the lemmata.

Individual Points

§1 The production by compression of clouds from air and of rain from clouds rather precisely parallels the series of transmutations of air according to Anaximenes at Simp. in *Phys.* 24.29–31 (13A5 DK), ‘air when condensed becomes

wind, and then cloud, and when even more condensed water', and Hipp. *Ref.* 1.7.3 (13A7 DK), 'winds are compressed air, from air a cloud is formed by compression, and when even more (compressed), water'.

The information about hail and snow in the mss., as Diels saw, is certainly mistaken, because it is always snow that is said to contain pneuma (this explains its colour). The mistake, shared by P and S, is to be attributed to A, which is why we have not interfered with the transmitted text.

§4 The combination ἀρκτική αἰτία cannot be paralleled. The adjective means either 'northern' or 'placed at the beginning of a sentence'. προκαταρκτική αἰτία, 'antecedent cause', on the other hand, is standard Stoic and then more general terminology (as in medical literature). The mistake is easily explained, viz. through contrasting association ('cold') with the preceding word θερμότητος. For causal terminology in the *Placita* cf. the auxiliary cause in the previous chapter, A 3.3.8, συναιτιᾶται δὲ καὶ τὸ πνεῦμα, and the originally Stoic cohesive cause at A 5.30.1, Ἀλκμαίων τῆς μὲν ὑγείας εἶναι συνεκτικὴν τὴν ἰσονομίαν τῶν δυνάμεων.

§5 This is Epicurus' first appearance in Book 3, not, however, with a plurality of equivalent doxai. This happens only at ch. 3.15.11 below, where he appears for the second and last time in this Book. See further Runia (2018) at M–R 4.382.

§§5–6 The not entirely intelligible remains of the doxa in the name-label-less *lemma mutilum* at the end cannot plausibly be attributed to any individual or school. Diels' suggestion ad loc. in the *DG* that it may nevertheless be Epicurean was rejected by Wachsmuth and (implicitly) Usener, and has not found favour. Even so, the combined doxai may well have been meant as a single lemma by P.

e Other Evidence

Of Seneca's *Naturales quaestiones* Book 4B (originally Book 3) only the second part, treating hail and snow, is extant, but in the lost part Seneca (preserved in excerpts by Ioannes Lydus) also discussed cloud, rain, dew and frost. For Lucretian parallels to the present chapter see Ernout–Robin (1928) 3.253–257, 259–260 (on clouds), 3.261–266 (on rain), 269–270 (on snow, winds, hail, cold frosts, ice).

Traditio ps.Plutarchi:

ps.Galenus HPh c. 78 (~ tit.) Περὶ Ἰριδος (text Diels)

- 78.1 (~ P1) τῶν μεταρσίῳ παθῶν τὰ μὲν καθ' ὑπόστασιν γίγνεται οἷον ὄμβρος χάλαζα, τὰ δὲ κατ' ἔμφασιν οὐκ ἔχοντα σύστασιν ἰδίαν,
- 78.2 (~ P3) ὥσπερ ὅταν καμπύλας γραμμὰς ὁρώμεν, τὰ δὲ κατὰ τῶν λίθων τῶν διαυγῶν καὶ κεράτων (λεπτομερὴ γὰρ ταῦτα πάντα) καὶ καμπύλας δὲ γραμμὰς, ὥσπερ τὰ καθ' ὕδατος ὁράται· κάμπτεται γὰρ πρὸς τὴν πυκνοτέραν τοῦ ὕδατος ὕλην ἢ ὄψις. διὸ τὴν κώπην ἐν τῇ θαλάττῃ ὁρώμεν κεκλασμένην.
- 78.3 (~ P4) τρίτος δὲ τρόπος τοῦ βλέπειν τὰ ἀνακλῶμενα ὥσπερ τὰ κάτοπτρα. ἔστιν οὖν τὸ τῆς Ἰριδος εἶδος τοιοῦτον. (δεῖ) γὰρ ἐπινοῆσαι τὴν ἀναθυμίασιν τὴν ὑγρὰν εἰς νέφος μεταβάλλουσαν, εἶτα ἐκ τούτου κατὰ βραχὺ εἰς μικρὰς ῥανίδας δροσιζούσας μετιοῦσαν· ὅταν ὁ ἥλιος γένηται ἐν δυσμῇ (ἀνάγκη γὰρ πάσαν Ἰριν ἀντικρυς τοῦ ἡλίου γίγνεσθαι), τότε ἡ ὄψις προσπεσοῦσα ταῖς ῥανίσιν ἀνακλᾶται, ὥστε συμβαίνει τὴν Ἰριν.
- 78.4 (~ P5) εἰσὶ δὲ αἱ ῥανίδες οὐ σχήματος μορφαὶ ἀλλὰ χρώματα φαίνεται. τὸ μὲν γὰρ πρῶτον ἔχει φοινικούν, τὸ δὲ δεύτερον ἀλουργές καὶ πορφυρίζον, τὸ δὲ τρίτον κυανούν καὶ πράσινον. μήποτε τὸ μὲν φοινικούν, ὅταν ἡ λαμπρότης τοῦ πυρὸς προσπεσοῦσα ἀνακλᾷ τὸ χρῶμα. τὸ δὲ δεύτερον μέρος ἐπιθολούμενον καὶ ἐκλυόμενον μάλλον τῆς λαμπρότητος διὰ τὰς ῥανίδας ἀλουργές δοκεῖ. ἔτι δὲ μάλλον τὸ δροσιζόν μεταβάλλεται.
- 78.5 (~ P6) ἔστι γὰρ τοῦτο δοκιμάσαι δι' ἔργων· εἰ γὰρ τις εἰς τὸ ἀντικρὺ τοῦ ἡλίου λάβῃ ὕδωρ καὶ † πιτύι, αἱ δὲ ῥανίδες ἀνάκλασιν λάβωσι πρὸς τὸν ἥλιον, εὐρήσει ἐγγιγνομένην Ἰριν. καὶ οἱ ὀφθαλμιῶντες δὲ τοῦτο πάσχουσιν, ὥς ὅταν εἰς τὸν λύχον ἀποβλέψωσιν.
- 78.6 (~ P7) Ἀναξιμένης δὲ Ἰριν γίγνεσθαι νομίζει κατ' ἀνταυγασμὸν ἡλίου πρὸς νέφει πυκνῷ καὶ παχεῖ καὶ μέλανι παρὰ τὸ μὴ δύνασθαι τὰς ἀκτῖνας εἰς τὸ πέραν διακόπτειν ἐπισυνισταμένας αὐτῷ.
- 78.7 (~ P9) Μητρόδωρος δὲ ὅταν διὰ νεφῶν ὁ ἥλιος διαλάμπῃ, τὸ μὲν νέφος κυανίζειν, τὴν δ' αὐγὴν ἐρυθραίνεισθαι φησιν.

Julianus Arianista in Job p. 269.18–270.9 Hagedorn (~ P3–5) καὶ τούτου ἱρὶν θαυμαστὴν ἀποστέλλω σοφίᾳ τῇ ἐμῇ ὥσπερ γραμμαῖς τιςιν εὐθείαις λόγῳ θεωρηταῖς καὶ νῶ περιληπταῖς. ἡ γὰρ ὑγρὰ οὐσία εἰς νέφος μεταβαλλομένη ἐκ τοῦ κατὰ βραχὺ εἰς μικρὰς ῥανίδας νοτίζεται· ἐπὶ δὲ ὁ ἥλιος γένηται ἐν δυσμαῖς, εὐθὺς ἡ ἀψὶς αὐτῆς κυρτοῦται εἰς κάλλος ἀμύχανον. ἡ γὰρ ὄψις προσπεσούσα ταῖς ῥανίσιν ἀνακλᾶται, καὶ γίνεται (τὸ) τόξον. αἱ δὲ ῥανίδες οὐ σχήματος μορφὴ ἀλλὰ χρώματος, τὸ μὲν πρῶτον φοινικοῦν, τὸ δὲ δεύτερον ἀλουργές, καὶ τὸ τρίτον κυανοῦν καὶ πράσινον. τὸ φοινικοῦν γὰρ ὑπὸ τῆς λαμπρότητος τοῦ ἡλίου καταυγασθὲν ἀκραιφνῶς τῇ ἀνακλάσει ἐρυθραίνεται, τὸ δὲ δεύτερον ἐπιθολούμενον καὶ ἐκλύομενον μᾶλλον τῆς λαμπηδόνης διὰ τὰς ῥανίδας ἀλουργές γίνεται (ἄνεσις γὰρ τοῦ ἐρυθροῦ (τούτου)), ἔτι δὲ μᾶλλον ἐπιθολούμενον τὸ διορίζον εἰς τὸ πράσι-
νον μεταβάλλει.

Psellus Omn.Doctr. c. 142 Περί ἱριδος (~ tit.)

142.2–5 ἡ ἱρίς ... τῇ φύσει μὲν ἀνυπόστατον ἐστίν, ἐμφασίς δέ ἐστι καὶ φάντασμα τῆς ὁρώσης ὀψεως, ἀκτίνων ἀπὸ τῶν ὀφθαλμῶν προσπιπτουσῶν, εἴτα δὴ ἀνακλωμέ-
νων (~ P3).

142.11–12 ἔστι δὲ πᾶσα ἱρίς τρίχρους· ἡ μὲν γὰρ ἐντὸς αὐτῆς ζῶνῃ φοινικῇ, ἡ δὲ δευ-
τέρα πράσινος, ἡ δὲ τρίτη ἀλουργὸς καὶ οἷον ὑποπόρφυρος (~ P5).

For an English translation of the Aëtian text see Volume 5.4

Commentary

A *Witnesses*

The witnesses are P, variously represented by P^B, P^G, P^G and P^Ps, and S. The first part of the chapter consists of six lemmata presented by P and S and in the same order. P^G, as usual, leaves out several lemmata (this time two), while Q omits one lemma, viz. §2 with its references to myth and its poetic quotation. One suspects that he found this doxa a bit awkward for religious reasons (he was a Syrian Christian). The chapter of S treating of the rainbow etc. (1.30) in which he cites the present chapter comes before the chapter (1.31) in which he cites A ch. 3.4, so he has inverted the order of the Aëtian chapters. And his text, which

misses the final three lemmata, is (exceptionally) not so good in the part that has been preserved. The Byzantine excerptors of S are probably responsible for the loss of these lemmata *ad finem*, because it is hard to believe that S would not have been interested in the three Presocratic doxai that are cited, and there was nothing to replace them by.

T, as we know, had no use for Book 3.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The rich proximate tradition is represented mainly by Seneca (the substantial account *Nat.* 1.3–9 (= Book 7 in the original order)), ps.Aristotle *De mundo*, Arius Didymus, the *Scholia in Aratum*, Calcidius and the *Epitomai* of the Aristotelian *Meteorology* mentioned below. Lucretius is surprisingly brief. The Aristotelian abstract at Seneca *Nat.* 1.3.8, only partly reproduced below section E(a)§3, is somewhat better than the one in our present chapter. The *Metarsiology* of Theophrastus(?) lacks a chapter on the rainbow (just as is the case for the Milky Way, see above ad ch. 3.1 Commentary B, and also for meteors and comets, see above ad 3.2 Commentary B).

(2) *Sources.* For §§1–6 we may think of a treatise (or part of a larger work) ‘On the Rainbow’, with a carefully written introduction (represented by §§1–3) that is both systematic and not without literary pretensions with its references to Plato, Homer, and an unknown mythographer. §3 is a digest of contemporary optical theory that provides an update of the optics of Aristotle in *Mete.* Book 3 (on §3 see further section D(d) below). §§4–6 ultimately derive from Aristotle’s *Meteorology*, as e.g. already Ideler and Diels, and now Daiber (commenting on Q), have pointed out. But the name-label ‘Aristotle’ is conspicuously absent. Ideler (1834) 1.268 writes: ‘Excerpta ex capitibus II–V [sc. of *Mete.* Book 3] reperiuntur apud Stobaeum Eclog. I, 31 [= c. 1.30 Wachsmuth] ..., nullo tamen in iis exscribendis a scriptore certo ordine observato.’ Daiber (1980) 423 refers to *Mete.* 3.4 373a32–375b15. Diels *DG* 60–61 (cf. *ibid.* 178) thought of an intermediate source: ‘suspicio Aëtio hic praesto fuisse quoddam de meteoris enchiridion, quod in opinionibus minus quam in rebus ipsis explicandis versabatur’. Such a source, though not entirely the sort Diels had in mind, has since become available; see below section D(e).

There is no precedent in Aristotle’s *Meteorology* for the final three lemmata. For the proximate tradition to these lemmata in Lucretius and others see Ernout–Robin (1928) 3.267–269.

C *Chapter Heading*

Of the umbrella type (περί τοῦ δεινᾶ) that dominates in the *Placita* (see above, ch. 1.3 Commentary C). The contents of the chapter shows that under it fall the

question types/categories of substance, quality, and the question type of cause ((διὰ τῆς), as well as the sub-question *unde*.

§3 begins with a formula closely resembling a certain type of chapter heading, viz. πῶς οὖν γίνεται ἱρις, but the οὖν shows it is not a heading (or is so no longer). Even so, the contents of this paragraph are analogous to those of a chapter beginning with Πῶς or having πῶς a little later. We are dealing with a problem and its solution (cf. ζητεῖται πῶς, a formula already used by Aristotle). We may compare *Placita* headings beginning with πῶς γίνεται (or γίνονται), as for instance at chs. 2.19 and 4.11, and quite often in Book 5. See further above, ch. 1.4 at Commentary C.

D Analysis

a Context

For the explanation of A's order in general see above, Introduction to Book 3, section 2. The chapter on the rainbow, number five of the nine chapters dedicated to atmospherical phenomena, follows upon ch. 3.4 on clouds etc. and comes before ch. 3.6 on rods. But in Aristotle's *Meteorology* the rainbow is treated quite far away from the clouds etc., namely at *Mete.* 3.4–5, after the halo *Mete.* 3.2–3. Epicurus *Ep.Pyth.* at Diogenes Laertius *V.P.* 10.110 discusses the halo after the rainbow.

b Number–Order of Lemmata

We have numbered the lemmata of this long chapter for the sake of convenience (Diels divided the text into twelve parts). According to this numbering P has nine lemmata—that is, P^B alone, because not only G, but Q, too, lacks §2. S, lacking the final three items, has six lemmata. In both sources the lemmata order is the same, and like Diels we have of course seen no reason to change it.

c Rationale–Structure of Chapter

The chapter on the rainbow consists of two main parts. The long first part (§§1–6) is a mini-treatise on the rainbow without a name-label for the doxa it contains, the second a block of three doxai with name-labels after the usual fashion of the *Placita*. Diels already pointed this out, *DG* 60: 'genuina sunt ... [3]5.10–12 [our §§7–9]. plane diversae farinae est eiusdem capitis initium [sc. our §§1–6]. neque enim placitorum est enarratio, sed ipsius doctrinae, cui Platonis Homerique nomina dumtaxat decoris causa interponuntur. ... accersita est prior de iride disputatio et ex alieno conexu divulsa, limpidus autem Placitorum fons in extremis paragraphis agnoscitur'.

As to the doxai there is a clear diaphonia between the (Aristotelian) section at §§4–5, according to which the rainbow is the result of the reflection

of the visual rays from the droplets of the cloud to the sun, and §§7–8, name-labels Anaximenes and Anaxagoras (both belonging to the Ionian succession and mentioned in chronological order), according to which it is on the contrary the light of the sun that is reflected towards our eyes via a cloud. The doxa of Metrodorus, §9, is not clear about this opposition, so fails to fit the diaeresis and therefore is aptly located in the ultimate position. This diaphonia is in favour of accepting the pseudonymous doxa as belonging with the original chapter structure (or replacing an original more compact set of doxai).

At the beginning of his chapter on the rainbow, *Mete.* 3.4 373a32–34, Aristotle states that it has been established that the rainbow is a reflection (category of substance, or rather quasi-substance), but that what sort of reflection it is (question-type of quality), and how and because of what (question-type of cause) it comes to be still has to be determined. These categorical and causal approaches to the issue are also well represented in our present chapter.

d Further Comments

General Points

An important contrast in Book 3 is between phenomena that are real (καθ' ὑπόστασιν), and those that are merely optical (κατ' ἔμφασιν), or rather optical illusions, as the comparison with the land that seems to move when we are sailing past it shows (πλεόντων ἡμῶν ἢ ἡπειρος κινεῖσθαι δοκεῖ). See also above, Introduction to Book 3, section 2. It is the only piece of general introductory material that is found in both P and S, or rather that is copied out by S, who omitted all other introductory material.

In A this contrast is made explicit only here, at the beginning of ch. 3.5. This postponement of the stipulation of this preliminary consideration (which puzzled Diels) faithfully reproduces the procedure of Aristotle's *Meteorology*, where it is made a thematic issue as late as and only in Book 3, which treats the rainbow and similar phenomena in chs. 3.2–6. In A it is already present at the beginning of chs. 3.1 and 3.2, just as in the dialectical passages in the *Meteorology* that correspond to these lemmata, as well as in other lemmata. See further M–R 2.1.43–46.

Apart from these dialectical passages there are only a few incidental remarks dealing with this contrast in *Mete.* Book 1 (not discussed in Mansfeld 2005a). See *Mete.* 1.5 342b5–15, in the discussion of the aurora borealis: the phenomena may be appearances of burning substances, but the air by reflection (ἀνάκλασις) may produce various colours too, since (as with the rainbow in Book 3) not shape but only colour is rendered. It will do so only briefly, because the composition (σύστασις, sc. of the condensed air) lasts only briefly—thus a blend of σύστασις and ἀνάκλασις, as of ὑπόστασις and ἔμφασις at ch. 3.6. At *Mete.* 1.7

344b1–18 Aristotle argues that the tail of the comet is a kind of stellar halo, though its colour is real and not, like that of the sun's halo, due to reflection (ἀνάκλασις). Against Hippocrates and Aeschylus he then argues that the comet cannot be a reflection (ἀνάκλασις), and certainly not one towards the sun (ἀνάκλασις), cf. Strohm (1984) 146. But 'the cause of the halo will be treated later'. For the phenomena of reflection (reflection, echo, rainbow) as a separate set see *APo.* 2.15 98a24–29, cited below section E(b) General texts.

Wilson (2013) 236–238, admitting that in view of the description of the meteorological phenomena, proceeding from the sphere below the heavenly bodies to what is underneath the surface of the earth, the reflections could very well have been discussed somewhere before, argues that Aristotle postpones their treatment to Book 3 'almost certainly ... for architectonic and etiological reasons'. He compares the position of special and valuable themes reserved for the final books of *Physics* (First Mover) and *Nicomachean Ethics* (contemplative life). In the *Meteorologica* this role would have been given to the mathematical explanations of the reflections. Though this interesting motif may have played a part, we believe that the distinction between phenomena that are real, or have some sort of real subsistence however temporary this turns out to be, and those that are a matter of optical illusion, is more important. This aspect has been argued in a paper overlooked by Wilson, namely Mansfeld (2005a), repr. in M–R 3.476–514. Wilson argues that the method of dichotomous division is not applied in the *Meteorologica*, but this does not entail that we cannot have polar oppositions, or one or more divisions that begin as dichotomous ones and go on in a non-dichotomous way (as instanced in quite a few *Placita* chapters). As a matter of fact, another dichotomous division, or polar opposition, is found at the beginning of the concluding passage (assuming this is authentic and not a later fabrication introducing Book 4) of *Mete.* 3.6 378a12–16, where the effects of the exhalations above the earth's surface (namely both the real and the optical phenomena treated so far) are contrasted with those enclosed in the earth, the latter very briefly mentioned in what follows. John Philoponus in *Mete.* 1.24–2.7 is very clear about this bipartite deep structure of the *Meteorology*. Providing a list of meteorological phenomena from rains to thunderbolts, he tells us that these 'have existence and are really what they appear to be' (ὑπαρξιν ἔχει καὶ ἔστιν ἀληθῶς οἷα περ φαίνεται), while others have 'only appearance and (generate) optical illusion, as they are not as to existence what they appear to be (μόνην ἔμφασιν ἔχει καὶ ὄψεων ἀπάτην οὐκ ὄντα καθ' ὑπαρξιν οἷα φαίνεται), such as rainbow and halo and rods and mock suns and the like'.

The didactic nature and structure of the mini-treatise on the rainbow of ch. 3.5.1–6 are clearly brought out by the formulas at the end of §1 and the beginning of §3, §4 and §6. At §1[4] ἔστιν οὖν κατ' ἔμφασιν ἢ ἱρις, the scientific

treatment of subject is announced. At §3[10] πῶς οὖν γίνεται ἱρις; the problem is formulated, while §4[18] ἔστιν οὖν τὸ τῆς ἱριδος πάθος τοιοῦτον its solution is introduced. At §6[31] ff. ἔστιν οὖν τοῦτο δοκιμάσαι δι' ἔργων, this solution is verified by a homely experiment that was already known to Aristotle (and presumably to most of us). The link between the formulas πῶς οὖν, introducing a problem, and ἔστιν οὖν, introducing a solution, can be paralleled from technical literature: see e.g. Herodian Περὶ παθῶν, *Gr.Gr.* 3.2, p. 329.13–17 Lenz, πῶς οὖν κτλ.—ἔστιν οὖν εἰπεῖν, ὅτι κτλ., and *Scholia vetera in Iliadem* E 576, Vol. 2 p. 81 Erbse, πῶς οὖν τῷ υἱῷ ἔπεται κτλ.—ἔστιν οὖν ὁμωνυμία κτλ. The question πῶς οὖν γίνεται ἱρις; is also answered by ἱρὶν γίνεσθαι spelled out in §7 and implied in §§8–9.

Individual Points

§2 'Regarding the rainbow, all that the doxographers could find in Plato was that Iris is the daughter of Thaumas (would Plato not have been amused to see the mild joke of the *Theaetetus* solemnly booked among his 'physical opinions?'). Thus Solmsen (1960) 416. True enough, but one should also take into account the quotation of Homer and the anonymous mythographer adverted to at section B above.

§3 Straight, bent, and reflected lines (γραμμὰς εὐθείας, καμπύλας, and ἀνακλωμένας) correspond to the tripartition of optics into respectively general optics (direct vision), dioptrics (refraction, as of the stick seemingly broken in water), and catoptrics (reflection, i.e. vision via mirrors as explained in §4 of the present chapter). The lines are theoretical and incorporeal, which means that they are the mathematical lines of theoretical optics. The assumption is that the visual rays can be imagined to move along such lines. So the present terse summary gives an outline of contemporary theoretical optics. As to optics and catoptrics it is rather precisely paralleled several centuries later in Calcidius' account and explanation, at *in Tim.* c. 238 and c. 242, of what (he says) the geometers and Peripatetics respectively call *phasis* (direct vision—the Greek term is unparalleled in this sense, but Ptolemy used φάσις for the apparition of a heavenly body), *emphasis* (reflection) and *paraphasis* (not refraction but vision via a dark or muddled medium—the Greek term is unparalleled in this sense). Damianus (cited by Waszink on Calcidius ad loc.) uses the equally rare terms ἰθυφάνεια ('direct vision'), ἀντιφάνεια ('reflection'—but he also uses the standard term ἀνάκλασις), and διάκλασις/διαφάνεια ('refraction'). Geminus' account of mathematics cited by Proclus *in Eucl.* 40.8–22 describes optics, catoptrics and 'scenography' as related disciplines. Ptolemy's and the great Arabic scientist ibn al-Haytham's (Alhacen's) *Optics* deal with, successively, optics (direct vision), catoptrics (reflection), and dioptrics (refracted vision). Ptolemy's

Optics is too late for A (note that §§3–4 are found in both P and S), so for the *Placita* a predecessor of Ptolemy would be relevant, e.g. Euclid, the author of both an Ὀπτικά and a Κατοπτρικά. Heron may also be involved, presumably indirectly; he is the author of a Περί διόπτρας and cited as that of a Κατοπτρικά (at Damian. *Opt.* 14.5–6, but identification of ps.Ptolemy *De speculis* as a Latin translation of this work is no longer accepted by Jones 2001, 149–151). We can also think of Geminus on mathematics as cited by Proclus (see above). One cannot, however, exclude that Ptolemy's *Optics* has in some way left its mark on Calcidius' presentation. (Ps.Ptolemy's *De speculis* did leave its mark, for Calcidius' account of *paraphasis* is paralleled at *Spec.* [5].8–12 Jones, as Waszink points out ad loc.). We have not found (but may have missed) a discussion of the Aëtian and Calcidian evidence in the learned literature concerned with the history of (ancient) optics, which is why we deal with this issue here at some length.

§§4–6 Aristotle's use of the (mathematical) visual ray in *Meteorology* Book 3 contradicts his theory of visual perception in the *De anima* and *De sensu*, esp. ch. 2, where the visual ray is strongly criticized, as was already seen by the ancient commentators, e.g. Alexander in *Mete.* 141.3–142.20. See also *Top.* 1.14 105b6–11 (cited below, section E(b) General texts), where on the other hand the view that visual perception is a matter of intromission is cited as being close to an *endoxon* or reputable opinion. Intromission is also rejected at *de An.* 2.10 422a14–15 and *Sens.* 3. 440a15–17. That 'seeing' means 'emitting rays' is also presupposed in Aristotle's mathematical account at *Mete.* 1.8 345a25–31 of the explanation of the Milky Way by Anaxagoras (59A80 DK) and Democritus (68A91 DK): 'they say that the Milky Way is the light of certain stars, for the sun, when moving underneath the earth, does not see some of the stars' (φῶς εἶναι τὸ γάλα λέγουσιν ἀστρων τινῶν· τὸν γὰρ ἥλιον ὑπὸ τὴν γῆν φερόμενον οὐχ ὁρᾶν ἔνια τῶν ἀστρων κτλ.). This use of ὁρᾶν and περιορᾶται, unique for the genuine Aristotle—Bonitz 520b17–20 cites parallels from two chapters in the *Problemata* for 'ὁ ἥλιος ὁρᾶν dicitur eos locos quos collustrat'—echoes the idiom found in poetry, e.g. *Od.* 11.16 Ἥελιος φάεθων καταδέρεται ἀκτίνεσσιν; see further at ch. 4.13 below, Commentary D(c) ad init. Perhaps Aristotle quotes something actually said by Anaxagoras or even Democritus. For this issue in general cf. again ch. 4.13 below, Commentary D(c).

This inconsistency is sharply criticized by Galen, *PHP* 7.7.10–15. Alexander sticks to the rival doctrine of the *De anima*, see in *Mete.* 141.3–12 (Greek text quoted at section E(b) §§4–6): 'he does not agree with the doxa that tells us that we see by means of the effusion of rays, as the followers of the mathematicians say, an implication of which doxa is the doxa that tells us that we see all that is seen through an appearance in mirrors by a reflection of these very rays.

... That this is impossible has been demonstrated in (our) *On How we See*, and Aristotle himself refers to these matters in his *On the Soul*. But in the *De anima* Aristotle mentions visual reflection only once. He does so in the context of his preference for the stimulation of sight by the unified intermediate air (affected by the shape or colour of an object via a smooth surface), over against the idea that sight proceeds from the eye; see *de An.* 3.12 435a5–8. ‘Although this passage speaks of reflection, it is not an explanation of reflection but rather of all vision through a medium’ (Jones 1994, 58 n. 18). The noun ἀνάκλασις as well as the verb ἀνακλᾶσθαι do occur here, and ἀνάκλασις is also mentioned in the account of sound, *de An.* 2.8 419b15–18. The word also occurs three times in Aristotle *De sensu*, namely 2 437b10, 438a8–10, but not as an ingredient of a worked-out theory. Merker (2002) 195 points out that in the *Meteorology* Aristotle does not provide a theory of visual perception, but ‘utilise la vision pour expliquer un phénomène météorologique’. We may add that Aristotle elsewhere (*GA* 5.1 781a3–8, cited below, ch. 4.13 section E(b) General texts) says that it *does not matter* (!) whether one explains vision by means of extramission or intromission. Galen *PHP* 7.7.11–12 (cited below section E(b) General texts), referring to what must be this passage, is scandalized by this cavalier attitude. On the other hand, the *Vita Marciana* 38–39 attributes to Aristotle the addition to physics of the extramission theory, and of the visual cone. See also below at ch. 4.13 Commentary D(d) individual points, §9.

The passage at *APo* 2.13 79a10–14, cited below section E(b) General texts, may perhaps be interpreted in the sense that the rainbow is to be explained optically in general terms on the one hand, namely as an optical and not a substantial phenomenon, and in strictly mathematical terms (κατὰ τὸ μάθημα, which implies the use of the visual ray in a diagram) on the other.

Mansfeld (2005a) 24–25, points out that the contradiction between the *Meteorology* and the psychological treatises noticed by the Aristotelian commentators is not an issue in the *Placita* and related literature. He also argues, *ibid.* 50, that the name-label Aristotle is absent in the present chapter because the author of the *Placita* may (exceptionally) have believed this explanation of the rainbow to be correct. But the reason may also be that there is no good reason. The (Aristotelian) doxa is after all in a state of diaphonia with two of the Presocratic doctrines cited ad fin., so can hardly be assumed to be correct.

There is also the further question of the real or possible interpolations in Aristotle’s mathematical proofs concerned with the rainbow at *Mete.* 3.5, see Vitrac (2002) and Wilson (2013) 251–270, with references to earlier discussions (among which the pioneering article by Tannery 1886), but this is not relevant in our context. For the problems (which we do not have to solve here)

concerned with the references in various *pragmateiai* to optical rays and the transparent medium see further e.g. Hahm (1978) 63 and Jones (1994) 56–64. Aristotle's standard view of the transparent intermediate medium is cited in A's chapter 'On vision' at 4.13.9, but there is no reference to his views in ch. 4.14, 'On mirror images'.

§4 Catoptrics is perhaps mentioned not second but last because seeing a rainbow is explained *more aristotelico* by referring to the reflection of the visual rays. But note that the same order is found at ps.Ptolemy *Spec.* [2].1–5 Jones, cited section E(b)§3.

For 'scenography' see below, ch. 4.13 at Commentary B.

§5 The query πῶς οὖν γίνεται ἶρις is not followed by a formal ἢ δ' ἶρις οὕτως ἀποτελεῖται (for such a formula cf. 3.5a(olim 18).1) but immediately by the solution.

Daiber (1980) 423–424 points out that the Aristotelian order of the colours of the rainbow (1. φοινικοῦν 2. πράσινον 3. ἀλουργές 4. πορφυροῦν) has been modified to 1. φοινικοῦν 2. ἀλουργές and πορφυροῦν 3. κυάνεον καὶ πράσινον. He also adverts to the fact that they fade as the clouds become moister, which is not paralleled in Aristotle.

§8 It is an interesting coincidence, and perhaps more than a coincidence, that the line of the *Iliad* (17.547), a scholion on which preserves the Anaxagoras fragment cited on this paragraph in section E(b) below, is also cited at the beginning of the present chapter in §2.

Also note that an explanation of mock suns is included, the only reference to this phenomenon in the present chapter. In Aristotle's *Meteorology* παρήλιοι are treated in Book 3, along with rainbows and halos, etc. See e.g. the announcement at 3.2 371b18–19.

e Other Evidence

A late *Epitome* of Aristotle's *Meteorology*, comparable to the source postulated by Diels for the Aristotelian section of our chapter, has since come to light and been translated from the Arabic (itself a translation of a lost Greek original) by Daiber (1975). The longer version of this work has been made accessible in its Arabic translation by ibn al-Bitriq and the Latin translation of this text by Gerardus of Cremona by Schoonheim (2000), but there is as yet no translation into a modern language. Much information on these works through comparison with Aristotle himself and the commentators is provided by Lettinck (1999). Seneca may well have availed himself of a similar *Epitome*.

Commentary

A *Witnesses*

(1) The witnesses are limited to P^B and P^Q, P^{Sy} for an abstract, and P^{Ps} for the heading alone. P^Q, though (as usually) omitting a few words, seems to have had at his disposal a better text for the final clause. It is not found in G, whose c. 88 (corresponding to P 3.17, on the tides) is immediately followed by c. 89 (corresponding to the first chapter of the next Book, P 4.1 on the rising of the Nile), see below at section D(a). It may have been absent in G's copy of P, or been left out for the sake of abridgement (see section D(a) below), or through an oversight.

(2) The chapter heading Περί ἱριδος περὶ ἄλω καὶ παρηλίου καὶ ῥάβδων of S 1.30 suggests that the evidence for halo (cf. the present chapter), rods and countersuns (cf. ch. 3.6), which he included by quoting AD fr. 14 Diels, made the citation of A's chs. 5a and 6 superfluous. It also supports our relocation of the present chs. 3.5 and 3.6, for which see below section D(a).

(3) T, as we have seen, has no use for Book 3.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* This consists of a remark in Pliny, a few rather different passages in Seneca, *Naturales quaestiones* Book 1, part of AD fr. 14 Diels, and several scholia on Aratus. Ideler (1836) 268 writes: ‘Excerpta ex capitibus II–V [sc. of *Mete.* Book 3] reperiuntur apud Stobaeum Eclog. I, 31 [= c. 1.30 Wachsmuth] ..., nullo tamen in iis exscribendis a scriptore certo ordine observato.’ S 1.30 consists of on the one hand ch. 3.5.1–6 (= §§1–10 Diels) on the rainbow plus on the other Arius Didymus fr. 14 Diels on the halo, rainbows, mock suns, so-called streaks and other optical phenomena. These two sources of course had not yet been distinguished, which explains part of the confusion diagnosed by Ideler.

(2) *Sources.* The main source is Aristotle *Mete.* 3.3, where however A’s explanation of the name *halos*, paralleled in Seneca, is not found. As was the case for ch. 3.5.1–6, Diels for our chapter too thought of a meteorological handbook as A’s source, but we may also think of a compendium of Aristotle’s treatise, see above at ch. 3.5, Commentary D(e). The doxa is without name-label, just as the (Aristotelian) doctrine of the rainbow in ch. 3.5. There is a single parallel at Theophrastus *Metars.* c. 14.2 Daiber, cited at E(b).

C *Chapter Heading*

P^B has the umbrella version (περί τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C). The longer version of Q refers to the moon but not to other heavenly bodies; it is not clear which version is to be preferred. However this may be, the main question type at issue covered by the heading is that of cause; the question type/category of substance and the category of place are of secondary importance.

D *Analysis*

a Context

The chapter on the halo, a phenomenon included among the μετάρσια announced in the prooemium of the treatise, does not really belong at the end of Book 3, immediately before ch. 4.1 on the Nile and after ch. 3.17 on the tides of ebb and flood that conclude the πρόσγεια announced in the proem to the Book and are said to have now been treated at ch. 3.8.2. A better location for it is directly after ch. 3.5 on the rainbow. See already Diels *DG* 60–61, and also our observations on these earlier chapters. Its omission by G may be significant, because P 3.17 and 4.1 together deal with the terrestrial waters and are interrupted by the chapter on the halo (see ch. 3.17, Commentary D(a), and ch. 4.1, Commentary D(a)). Because we are trying to reconstruct A, not editing P, we have reinserted the chapter in what is its proper place. For confirmation

provided by the chapter title of S 1.30 see above, section A. However, it has to be admitted that it may have been moved to the end to lend an air of unity to the Book, providing a return to the *metarsia* of its first part after the treatment of the *prosgēia*.

Optical meteorological phenomena are discussed by Aristotle together in *Mete.* 3.2–5. In Theophrastus' (?) *Metarsiology* edited by Daiber, where no chapters on the earth or sea *per se* or, more remarkably, on the rainbow are found, the chapter on the halo (of the moon) is the penultimate ch. [14.], before ch. [15.] on earthquakes. Epicurus *Ep.Pyth.* at Diogenes Laertius *V.P.* 10.9–111 discusses the halo (of the moon) after the rainbow.

b Number–Order of Lemmata

There is only one lemma. This is exceptional (there are a few other instances, e.g. the long ch. 1.4, the brief ch. 3.6). Abridgement may be the cause, here as elsewhere.

c Rationale–Structure of Chapter

The lemma, the opening words of which are thetically formulated, has been articulated as if it answers the query πῶς οὖν γίνεται ἄλως; ('how does the halo occur?'), which in fact corresponds with the heading of Q! The main question type at issue is that of cause, the διὰ τί. In the Greek text of ch. 3.5.3, dealing with a related optical phenomenon, such a query is formulated *disertis verbis*: πῶς οὖν γίνεται ἱρις; No alternative explanations are extant in the present chapter, though a different view could have been added, namely that the halo around the heavenly body is not an optical phenomenon (δοκεῖ ... φαίνεσθαι, Seneca's *visus noster solita imbecillitate deceptus*) but a real one; it may have been omitted. It is the (only) view found at Theophrastus(?), *Metarsiology* ch. [14.] Daiber, *The account of the causes of the halo round the moon*.

d Further Comments

General Points

See above, section A.

Individual Points

§1 Diels unnecessarily brackets l. [6–7] ὃς κύκλος ... προσεικώς as a gloss.

e Other Evidence

The halo qua relatively important phenomenon of reflection is discussed in Epicurus (not in Lucretius), and in authors such as Seneca, Pliny, and Arius Didymus on Aristotle, and because of its treatment in Aristotle also in Alex-

ander's Commentary on the *Meteorology*. Seneca's account (cited section E(a) General texts) provides an excellent parallel to that of A.

Commentary

A *Witnesses*

The only witness is P, represented by P^B, and P^Q or rather Q, who makes a mess of the translation. The Byzantine excerptors are probably responsible for the loss of the lemma in the text of S. T as we know did not excerpt Book 3.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* A substantial account of beams (or rods) and mock suns is given at Seneca *Nat.* 1.9–13. There is no section on rods etc. in Theophrastus' (?) *Metarsiology*.

(2) *Sources.* An ultimate source for systematic treatment in context is Aristotle *Mete.* 3.6, but A, highlighting the mixed nature of these phenomena, is closer to certain representatives of the proximate tradition such as the *Scholia* on Aratus.

C *Chapter Heading*

In P^{BQ} and confirmed by P^{Ps}. The longer version in Photius' index and an opusculum of Psellus suggest that we should perhaps reconstruct a longer title: 'On rods and counter-suns'. The title itself is of the standard umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C). Here it covers the question type of cause (and the sub-type *unde*) as well as the question types/categories of substance and quality, and the category of place.

D *Analysis*

a Context

For the explanation of A's chapter order in general see above, Book 3.proœm. at Commentary D(a). The present chapter on rods and mock suns, the sixth in the succession of eight (or rather nine) chapters dedicated to atmospheric

phenomena, follows upon that on the rainbow and ch. 5a(olim 18) on the halo, and comes before that on winds. Already in Aristotle mock suns and rods at *Mete.* 3.6 are discussed after halo and rainbow at *Mete.* 3.2 *ad init.* and 3.4–5. In Seneca, too, rods and mock suns are treated at *Nat.* 1.9–13 after the rainbow at 1.3–8, while the halo precedes this at 1.2. The structural point concerning the blend of semblance and reality is a sort of appendix to that about semblance as opposed to reality in the preceding ch. 3.5, and to some extent helps to secure the position of the chapter in the chapter series.

b Number–Order of Lemmata

There is only one lemma. This is exceptional (there are a few other instances, e.g. the long ch. 1.4, the short ch. 3.5a(olim 18)). Abridgement may be the cause, here as elsewhere. There may have been more, but we cannot know this because S is absent. Because of the general nature of the lemma no name-label is included. This too is exceptional, but also occurs in ch. 3.5a.

c Rationale–Structure of Chapter

The possibly abridged lemma fails to tell us in detail how rods and mock suns come to be. Perhaps Q missed this aspect and tried to make up for this lack by his idiosyncratic translation of ἀνθηλίους. The structural point concerning the blend of semblance and reality is linked to that about the opposition between semblance and reality in ch. 3.5.

d Further Comments

Individual Points

§1 Aristotle, too, *de facto* allows for such mixtures; see *Mete.* 1.5 342b1–15 on the aurora borealis and similar phenomena: they are produced by reflection, while their substance only lasts for a short time. See further Stothers (2009) 36: ‘I suggest that streak [i.e., rod] is simply a multicoloured mock sun’.

Daiber’s translation of Q at (1980) 177 is incomplete; for the full text see p. 424.

e Other Evidence

This limited theme is discussed more or less briefly in more or less contemporary sources such as Seneca, Pliny, and Arius Didymus. For Aristotle see at section B above.

Commentary

A *Witnesses*

The witnesses are P, represented by P^P (snippets of four lines of §2), P^B, P^G, P^{Ps} and P^Q, and S. P has omitted §4, perhaps because Aristotle's dry exhalation has already been amply treated elsewhere. On the other hand S' truncated ch. 1.32 consists of §4 only, so the loss of §§1–3 in this branch of the tradition must again be due to the Byzantine excerptors. As Diels noted, in S the lemma from A is coalesced with a fragment of AD; see M–R 1.249–254, 3.325, and Jeremiah at M–R 4.286 and 353. T, as always for Book 3, is absent.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* Winds are the subject of Seneca *Nat.* Book 5 (= Book 4 according to the original order). Other relevant proximate sources are (as is usual in the present series of chapters) Pliny the Elder, ps.Aristotle *De mundo*, Arrian and the *Scholia* on Aratus, which used to be derived from Posidonius and are still so attributed by Theiler.

(2) *Sources.* §4, Aristotle, is a straightforward abstract from *Mete.* 2.4. The sources for the other lemmata are not known. We may also cite ch. [13.] of Theophrastus' (?) *Metarsiology*, though the contents of this substantial chapter have little in common with our ch. 3.7.

C *Chapter Heading*

The heading, of the umbrella type (περί τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), is confirmed in all witnesses. It also occurs as a chapter heading elsewhere, and as a book title, e.g. of a tract of Theophrastus. Here it comprises the question type of cause (διὰ τί, and the sub-type *unde*) as well as the question types/categories of substance and quality, and the category of place.

D *Analysis*

a Context

For a general explanation of A's order see above, Introduction to Book 3, section 2, and Book 3.procēm. at Commentary D(a). In Aristotle the chapters on winds and *pneumata* in general, *Mete.* 2.4–6, are between those on the rivers (1.13–14) and the sea (2.1–3) and those on earthquakes (2.7–8). Treatment of this theme had been announced already at *Mete.* 1.13 349a12. Since *pneuma* plays an important part in the aetiology of earthquakes, the treatment of winds and all other *pneumata* appropriately comes before that of earthquakes. In Seneca's *Naturales quaestiones* Book 5 (originally Book 4), on winds, comes

before Book 6 (originally Book 5), on earthquakes, the same sequence as in Aristotle. In A the chapter on winds comes before ch. 3.8, on summer and winter as the last phenomena with an atmospheric aetiology (note the reference to summer in §3), while the chapter on earthquakes, 3.15, comes before the two chapters on the sea, 3.16–17.

b Number–Order of Lemmata

P has 3 lemmata, S only 1, and a different one at that. There is no need to interfere with P's order, for the doxai in §1 and §2 contrast with that of §3 (see below, section (c)). This order is also that of Diels in the *DG*. It seems reasonable to add S' lemma with name-label Aristotle at the end, after P's triad, minus the phrase from AD for which see below section (d)§4.

c Rationale–Structure of Chapter

The main diaphonia is between §§1–2, which explain wind as a flow of air, and §§3–4, which explain it as deriving from evaporation. The difference between §1 and §2 is slight, as it consists only in an explanation of the names of the winds in §2. A subsidiary diaphonia holds between the moist exhalation of §3 and the dry exhalation of §4 (with the second part of this doxa adding a compromise position as well). The question-type at issue is that of cause, the $\delta\iota\alpha\ \tau\iota$, and the category of place also plays a part (esp. in §2).

d Further Comments

General Points

Wilson (2013) 76–77 with nn. 6–7, and 196–216, argues that the wind forms the third of the ten groups into which Aristotle divided the meteorological phenomena; cf. above, ch. 3.3 Commentary C ad fin. The definition of wind as a flow of air was rejected by Aristotle but reinstalled by Theophrastus. The latter's *On Winds* begins with the statement 'The nature of the winds, from what and how and through what causes they come to be has been considered before' (Greek text quoted at section E(b) General texts). These aspects are therefore not the theme of this treatise, although they are not avoided, but they are discussed in the long c. 13 of Theophrastus' (?) *Metarsiology*, which is an additional argument in favour of the correctness of the attribution of the treatise.

Individual Points

§2 *Sprache der Griechen* (app. crit.): Q transliterates 'Zephyrus', meaningless in Arabic, and therefore adds an etymological derivation, i.e. *Dunkelheit* and *fließen*. Cf. chs. 2.1.1[2], 4.11.1[17], 4.12.1[9], and 4.19.3[7] and his adaptation of the chapter heading of 1.8.

§3 No satisfactory emendation of the corrupt word in this lemma has as yet been proposed (here one again misses the evidence of S). G omits it. We suggest that a 'Freudian lapsus' (as Timpanaro calls it) occurred, i.e. the easy corruption of a word, here because of the obvious association between πνεῦμα, 'spirit', and θεῖον 'divine' (or ἅγιον 'holy'). We therefore suggest θε(ρ)ι(ν)ῶν, 'summer winds', or perhaps rather 'breezes'. The Etesians blow from ca. 15 May to ca. 15 September, so are summer winds as well. Cf. §3[12] θερινήν and *Corpus Hippocraticum, Diaet.* 37.24 et 26 θερινῶν πνευμάτων, 'summer winds' (trans. Jones LCL). The summer solstice is at 21 June. Diels' suggestion ἀθρόων, based on Diogenes Laertius *V.P.* 10.104 and ps.Aristotle *Mu.* 4 394b9 is palaeographically unlikely.

For the formula ὁρμή τοῦ πνεύματος see e.g. Aristotle *Mete.* 2.8 368a9, ps.Aristotle *Probl.* 33.5 962a5.

§4 Diels and Wachsmuth attribute πνεῦμα μὲν ἐκ πολλῶν συνιουσῶν ἀναθυμιάσεων to A, but it seems more likely and simpler to have the Aristotelian doxa end at 3.4.2 μῆξιν and to attribute the phrase to AD's excerpt from Aristotle.

e Other Evidence

Not surprisingly, winds are among the most widely discussed atmospheric phenomena, and not only because the Greeks were a seafaring people. They are treated in substantial sections of Aristotle's *Meteorology*, namely chs. 1.13 and 2.4–6, in ps.Aristotle *On the Locations and Names of Winds*, in Theophrastus *On Winds*, in Theophrastus *On Weather Signs* 26–37, in ps.Aristotle *Probl.* 26 'What pertains to the winds', and also in ps.Aristotle *Mu.* 4 394b7–395a10. They also receive due treatment in the related literature, e.g. Seneca, Arrian, and Pliny (cf. B above), and in the architect Vitruvius. The *Placita* do not describe the various and more detailed wind roses that were current, but sticks to the early and principal rose of four winds. Seneca, for one, does discuss them: *Nat.* 5.16–17.

Commentary

A *Witnesses*

The witnesses are P, represented by P^B, P^G and P^Q, and S. §2 is only found in P^B, while §1 in S is preserved much earlier on at *Ecl.* ch. 1.8, under the heading 'On the substance of time and its parts and of how many things it is the cause'. This chapter in S also contains abstracts from ch. 1.21, 'On time', from ch. 1.22, 'On the substance of time', and from ch. 2.32, 'On the year' etc., which S has also collected by removing them from their original position in subsequent books of the *Placita*. T did not excerpt Book 3.

B *Proximate Tradition and Sources*

(1) *Proximate tradition*. The proximate tradition of §1 is rather sparse, apart from a rather general sentence in the Stoic Book 7 of Diogenes Laertius. Formulas resembling §1 are found in Seneca and Eusebius. There is no precedent in Theophrastus' (?) *Metarsiology*.

(2) *Sources*. The doctrine is Stoic, see Diogenes Laertius *VP*. 7.151 cited at section E(b)§1. There is virtually no precedent in Aristotle apart from general remarks about the motions of the sun.

C *Chapter Heading*

The heading, of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), is only preserved in the tradition of P. We have found no parallel elsewhere. It covers the question type of cause (διὰ τί), the category of the substance ('air', 'fire'), and the category of place ('higher', 'lower').

D *Analysis*

a Context

For the explanation of A's chapter order in general see above, Book 3.prooem. at Commentary D(a). The present chapter is the last in the series of nine consecutive chapters (including ch. 5a) dealing with atmospheric phenomena. It follows upon the chapter on winds (Lucr. *DRN* 5.736–748 treats seasons and

winds together). The single doxa it presents, on the vertical motions of air and fire which by turns press each other up and down, may perhaps be interpreted as providing a sort of appendix to ch. 3.7.1–2, which are about air movements that are, for the most part, horizontal. In Seneca the parallel material is found in a different context, viz. in Book 2 (originally Book 8), ‘On lightning and thunder’. §2 provides the announcement of the treatment of the terrestrial matters that occupy chs. 3.9–17. P’s isolated final chapter, 3.18, actually belongs with the series of eight, and more particularly after ch. 3.5, so we have given it the position 3.5a.

b Number–Order of Lemmata

Diels in the *DG* left a blank line between §1 and §2, which he failed to do at ch. 1.4, where a lemma of the standard type is likewise followed by an authorial remark. He may have done so because in ch. 1.4 this is linked to a single chapter only, while here it is linked to multiple chapters. It is of course entirely clear that §2, also looking forward to what is to follow, has to come after §1, as in the *DG*.

The little chapter may well be complete, but in the absence of most of S we cannot know.

c Rationale–Structure of Chapter

If we include the second part, we have two lemmata of an entirely different nature. In fact the structure, if we may use the term here, is that of a doxa followed by an attached authorial note, which we could easily separate out as at the beginning of the book, but for the sake of convenience we have kept the two separate parts together. In effect this chapter is monolemmatic, but unlike chs. 3.5a and 3.7 it has name-labels. Though there is a suggestion that the seasons follow each other in a cycle, this is not stated explicitly, as the emphasis is on the causal explanation of the heat of summer and the cold of winter.

d Further Comments

General Points

There is another chapter dealing with summer and winter in the *Placita*, viz. ch. 2.19 according to the second part of the title in P, and the ‘signs relating to winter and summer’ mentioned in its first lemma. Lucretius discusses summer and winter among the *caelestia*.

Individual Points

§1 βιαζομένου] ‘sc. τὸν ἥλιον, was wohl im Original aus dem Zusammenhange klar war’, DK ad loc. We note that the heavenly bodies, esp. the sun, are not

mentioned explicitly in our lemma, though they do appear in the parallels quoted below in section E(a) and (b).

§2 On this lemma see M–R. 2.1.55.

e Other Evidence

In most related texts the emphasis is on the regularity of the seasons' following one after the other.

Commentary

A Witnesses

The witnesses are P, represented by P^B, P^E, P^G and P^Q, and S, but for the title only. Because of the presence of the word μέγεθος in the heading according to S^{Phot}, Diels posited that a chapter on the size of the earth, analogous to the chapters on the size of the sun (2.21) and the moon (2.26) has been lost in P. This is of course possible but incapable of proof, though P the epitomator may have felt justified in omitting such a chapter because the terms ‘finite’ and ‘infinite’ already pertain to μέγεθος, ‘size’, in the present chapter.

The whole section on earth 3.9–16 in S has regrettably been excised by Byzantine excerptors. T did not excerpt Book 3.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The proximate tradition is limited.

(2) *Sources.* The main source is Aristotle, *De caelo* 2.13, the chapter on the earth, which discusses those issues in relation to each other, viz. substance and

number, shape, position, and motion or rest, that are treated separately in A's chs. 3.9, 3.10, 3.11 and 3.13. His methodology and terminology also shine through, while some name-labels of the *Placita* chapters on the earth are already found there as well.

C Chapter Heading

P^{EGQ} have the short title Περὶ γῆς, while P^B has a long title, namely Περὶ γῆς καὶ τίς ἡ αὐτῆς οὐσία καὶ πόσαι (or ποσὴ), one ingredient of which is confirmed by S^{LPhot} εἰ μία καὶ πεπερασμένη καὶ περὶ ποίου μεγέθους καὶ περὶ θέσεως αὐτῆς (who *ad finem* combines the heading with that of ch. 3.11). The convergent testimony of P^B and S regarding the category of quantity outweighs that of P^{EGQ}, who lack this specification. We have therefore opted for a longer heading, namely that of P^B and not of S, and have preserved P^B's reference to the category of substance not found in S.

In all our sources the heading starts out as a representative of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C). In P^B it continues with two of the issues represented in the chapter, pertaining to the category of substance and that of quantity, the latter not further specified. The heading in S^L omits the category of substance, but specifies the category of quantity as pertaining not only according to number (μία), but also to size (ποίου μεγέθους). Diels *DG* 62 as noted suggested that a chapter on the size of the earth has been lost. But Theon of Smyrna, *Exp.* p. 120.10–12 Hiller (ὅτι γὰρ σφαιρικὸς ὁ κόσμος καὶ ἡ γῆ σφαιρική, κέντρου μὲν κατὰ τὴν θέσιν, σημείου δὲ κατὰ τὸ μέγεθος πρὸς τὸ πᾶν λόγον ἔχουσα) and its sequel, shows that shape, location and size may be treated together. The limit of §3 and the one-sided infinity of §4 show that size is indeed included in the chapter.

D Analysis

a Context

This is the first of the seven consecutive chapters on the earth that have so to speak been interpolated in the series of meteorological chapters, beginning here with the earth's number, size, and substance, and concluding with ch. 3.15 on earthquakes. They are followed by chs. 3.16–17, on the sea. The background of chs. 3.9–14 is formed by ch. 2.13 of Aristotle's *De caelo*, while chs. 3.1–8 plus 3.15–17 (and the wrongly placed ch. 3.18, now 3.5a) relate to the *Meteorology*. Because A deals with his material from top to bottom, or from periphery to centre, he has so to speak interpolated the chapters on the earth (a cosmic body) between the two series of proper meteorological chapters. For Diels on a lost chapter see above at section C.

The categories of quantity and substance at issue in ch. 3.9 are appropriately followed by that of quality in the next, ch. 3.10. Compare the consecutive chs. 2.13 and 2.14, on the substance and shape of the stars, respectively; 2.20 (substance of sun and number of suns), 2.21 (size of sun), 2.22 (shape of sun); and 2.25 (substance of moon), 2.26 (size of moon), 2.26 (shape of moon). For the category of quantity in contexts like the present one see the statement of Gal. *Inst.Log.* 12.2, ἡ ζήτησίς ἐστι (τῆς) τοῦ κύκλου πηλικότητος ἢ τοῦ μεγέθους ἢ (τῆς) ποσότητος ἢ ὅπως ἂν θέλῃς ὀνομάζειν, cited more fully at ch. 3.14 section E(b).

b Number–Order of Lemmata

S only attests the heading. P^{BQ} have five lemmata, four of which are left in P^G, in the same relative order, which there is no reason to change.

c Rationale–Structure of Chapter

We may distinguish three blocks, two consisting of two lemmata and one of a single lemma. Their order is that of the themes at issue in the chapter, viz. number, size ('finite' vs. 'infinite'), and substance, with some emphasis on the origin of this substance. A neat diaphonia opposes and links the lemmata of the first block: the majority of §1 recognize a single earth, the Pythagoreans of §2 add a second one. An equally neat diaphonia opposes and links the lemmata of the second block: the earth of the Stoics of §3 is limited, that of Xenophanes in §4 is unlimited at one side. But the single earth of §§3–5, too, is opposed to the multiplicity of §2. The last lemma, Metrodorus' doxa in §5, does not come under the category of quantity of §§1–4, but pertains to that of substance; its final position is therefore the appropriate one of a maverick doxa.

See also Mansfeld (1992a) at M–R 3.75–94.

d Further Comments

Individual Points

§2 Here as elsewhere the *Placita* provide the name of an individual where Aristotle speaks of 'the Pythagoreans'. Hicetas is far more surprising than Philolaus would have been, esp. in view of the fact that Cicero *Luc.* 123 attributes the doxa that the earth turns about its axis and the other heavenly bodies are at rest to Hicetas on the authority of Theophrastus (*Phys.Op.* fr. 18 Diels, 240 FHS&G). Also cf. ch. 3.12.3 where this doxa is attributed to Heraclides and another Pythagorean again, Ecphantus.

§4 The lemma echoes Aristotle's description of the earth's infinity on one side, itself echoing a Xenophanes fragment that is extant verbatim. The second part of this paragraph on the earth's origin, which could constitute a separate lemma and originally maybe did so, links up with §5.

§5 The reference to the substance of the sun (which does not agree with the Metrodorus doxa at ch. 2.20.8) is extraneous to this chapter on the earth. Probably it is a remnant of a treatment of these matters in which the individual issues were kept apart a bit less rigorously than is generally the case in A.

e Other Evidence

For the present chapter (and chs. 3.10–11 and 3.10.13) we can cite Aristotle's treatment in *Cael.* 2.13, with echoes in the cousin writings, e.g. ps.Plutarch *Stromateis*, and related (esp. scientific) literature, e.g. Ptolemy.

Commentary

A Witnesses

The witnesses are P, represented by P^B, P^E, P^G and P^G, and S, who provides the title only. G coalesces §4 with the second half of §5 (τῷ πλάτει ... μέσῳ), and changes the final word μέσῳ to μεγέθει. T is again absent.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The proximate tradition is quite rich: not only the usual witnesses such as Pliny, Diogenes Laertius, and Hippolytus, but also astronomers such as Geminus, Cleomedes, and Ptolemy, and authors such as Marius Victorinus and Martianus Capella.

(2) *Sources.* The main source is Aristotle, *De caelo* 2.13, the chapter on the earth, which discusses those issues in relation to each other that are *more doxographico* treated separately here in chs. 3.9, 3.10, 3.11 and 3.13. Aristotle's methodology and terminology also shine through.

C Chapter Heading

Of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), and confirmed in the extant sources. For S it has not been preserved in the *index Photianus*, but in that of S^L, as heading for the lost chapter *Ecl.* 1.34. For what is under the umbrella see at section D(a) below.

D Analysis

a Context

This is the second of the seven consecutive chapters on the earth, beginning with the previous chapter and ending with one on earthquakes.

The category at issue is that of quality, as we are told *disertis verbis* by Galen (cited at section E(b) General texts). It follows harmoniously upon those of substance and quantity (according to the order in the heading) at issue in the previous chapter, and aptly precedes the category of place (the ποῦ) at issue in the next. Compare e.g. chs. 2.24 and 2.25, on the shapes of the stars and on their order, i.e. their relative position.

b Number–Order of Lemmata

P^{BE} has five lemmata, G four. The relative order is the same.

c Rationale–Structure of Chapter

The sequence of the name-labels from Thales to Democritus is chronological. This to some extent agrees with the diaeresis of the shapes, from more or less round to more or less flat: §1 sphere and §2 cylinder, then §3 table or slab, §4 kettle-drum, §5 flat disk with a hole in the middle that the other shapes do not have.

d Further Comments

General Points

It is sometimes claimed that the earth has the shape of a cube (cf. the quotation from Cleomedes, above), the result of a confusion of the earth *qua* cosmic body and earth *qua* element (consisting of cubical molecules in Plato, *Tim.* 55d γῆ μὲν δὴ τὸ κυβικὸν εἶδος δῶμεν).

Individual Points

§1 We have preferred the reading of E as confirmed by Q to that of P^B and G.

§2 The full text of Q enables us to supply the words lost in the Greek tradition.

§4 τυμπανοειδής means ‘shaped like a (kettle-)drum’ (‘kalottenartige Ausbuchtung nach unten’, Gilbert 1907, 282 n. 1). The adjective τυμπανώδης, never connected with σχῆμα but always with ἦχος, means ‘sounding like a drum’. For the parallel passage Diogenes Laertius *V.P.* 9.30 (missed by Mansfeld 1992a at M–R 3.75–94) the early ms. Φ has preserved the correct reading. That of BPF, as Tiziano Dorandi tells us *per litt.*, is the result of a majuscule mistake: OEI is easily misread as Ω. Some of the *deteriores* read τυμπανοειδέες, possibly the result of conjecture, and so has Cobet’s edition, which once again proves his mastery of Greek even if this time he was inspired by one of these later mss.

τυμπανοειδής actually is a rare and *recherché* word, which is only used for the shape of Leucippus’ earth (with the exception of two purely mathematical instances in Ptolemy *Anal.* 210.20 and 212.18). The doxa cited in A and Diogenes

Laertius derives from Aristotle, while the name-label is added *more doxographico*; it is also found in the same context in Simplicius. The restoration of the correct reading in Diogenes helps to understand the nature of his chapters on Presocratic *areskonta* as a rearrangement of passages pertaining to a single figure taken from systematic tracts dealing with specific issues in the manner of A, which means as doxai abstracted from the wider doxographical tradition.

§5 The cavity in the middle of Democritus' flat earth may perhaps be placed alongside the cavity in the spherical earth of Plato's *Phaedo*, 111e–112e.

e Other Evidence

For the present chapter (and chs. 3.9, 3.11 and 10.13) we must cite Aristotle's treatment in *Cael.* 2.13. The shape of the earth is already a subject in Plato's *Phaedo*. It has been discussed rather widely, not only in literature parallel to or comparable with the *Placita*, but also in astronomical writers (Ptolemy). There is a long argument in favour of sphericity in Manilius, 1.173–235.

Commentary

A *Witnesses*

The witnesses are P, represented by P^B, P^E, P^G. There is also a fragment of four lines which imply no changes for the *constitutio* of §3 in P^P. S, however, provides the title only. G this time has not abridged the chapter further. T is again absent.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* A number of secondary witnesses give evidence of similar discussions, perhaps at greater length, in the wider *Placita* tradition. There are texts in Achilles and the *Scholia* to Basil's *Hexaemeron*. A brief reference to the subject of the chapter in a letter of Isidore would also seem to betray acquaintance with a parallel tradition, perhaps via Basil; see M–R 1.311. Cicero, Pliny, Seneca, and related literature provide copious parallels.

(2) *Sources.* The main ulterior source is Aristotle, *Cael.* 2.13, the chapter on the earth, which discusses the location of the earth in relation to its substance and number, shape, and motion or rest, which are *more doxographico* treated separately in A's chs. 3.9, 3.10, and 3.13. His methodology and terminology also shine through. See further Mansfeld (1992a) at M–R 3.75–94.

C *Chapter Heading*

Of the umbrella type (περί τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), and found in P^B, P^G and P^Q. For S it has not been preserved in the *Index Photianus*, but in that of S^L as the last part of the heading of the lost chapter *Ecl.* 1.33, which combines the headings of chs. 3.9 and 3.11; see Wachsmuth (1882) 18. The category concerned is that of place (as Galen points out), while in §2 and §3 the question type of cause (διὰ τί) also plays a part.

D *Analysis*

a Context

This is the third of the seven consecutive chapters on the earth. The category at issue is that of place (the ποῦ), as we are told *disertis verbis* by Galen (*Inst. Log.* 13.7, text below in section E(b)§1). This aptly follows upon the category of quality of the previous chapter. It comes before four chapters dealing with specific issues that are relevant to the earth alone, just as in Book 2 the series of chapters on, respectively, the sun and the moon are concluded with groups of chapters pertaining to issues of specific interest for either the sun (chs. 2.23–24) or the moon (chs. 2.28–30); ch. 2.31 includes both moon and sun.

b Number–Order of Lemmata

P in all his representatives has four lemmata, of which we have transferred the final one to another chapter; see the discussion at section D(d) below. There is no reason to change the order of the remaining three.

c Rationale–Structure of Chapter

In terms of doxai the diaphonia is between §1, earth in the middle, and §§2–3, where there is no middle for the earth to be at (§2), or where there is something else, viz. fire, in the middle (§3). A further but rather slight disparity is found between §2, where our earth comes first, and §3, where it comes third and occupies a position after the counter-earth that comes second. As noted the category is place, while the question type in §2 and §3 is cause. In terms of name-labels the main contrast is between the Ionic Succession beginning with Thales and (a representative of) the Italic Succession, namely the Pythagorean Philolaus. A third position is given to Xenophanes, perhaps representing the Eleatic Succession of which he is the archegete; cf. below ch. 3.13 Commentary D(c).

d Further Comments

General Points

The fourth and final lemma transmitted in P (including G) is a doxa attributed to Parmenides on the inhabited zones of the earth. It has been displaced from ch. 3.14 and should be restored there. See our commentary ad loc.

Individual Points

§3 The *Placita* identify a person, Philolaus the Pythagorean, whereas Aristotle speaks of ‘the Pythagoreans’ in general. For this doxa and name-label cf. below, ch. 3.13.2.

e Other Evidence

For the present chapter (as for chs. 3.9, 3.10 and 10.13) we must again refer Aristotle’s treatment in *Cael.* 2.13. The position of the earth is already a subject in Plato’s *Phaedo*. It has been discussed rather widely, not only in literature depending on Plato or Aristotle, or parallel to or comparable with the *Placita*, but also in astronomical writers (Geminus, Cleomedes, Ptolemy).

Commentary

A *Witnesses*

The full text of witness P is represented by P^B and P^Q only. P^E supplies the chapter heading, but the text has fallen out (this may have already occurred in E's source) and the heading came to be attached to the next chapter. This chapter and the misplaced ch. 3.18 are the only chapters in Book 3 not included by G. T, again, is absent.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The proximate tradition is poor. The parallel for Leucippus in Diogenes Laertius points at the existence of a shared tradition.

(2) *Sources.* There is no reference in Aristotle. The book title *Geography*, Γεωγραφίη, cited in Diogenes Laertius' catalogue of Democritus' works perhaps suggests that this work may have been the source of the Democritus doxa, but it may equally well derive from one of his cosmological works. The doxa of Leucippus will derive from the latter's *Great Cosmic Ordering*, Μέγας διάκοσμος, but we do not know by what route.

C *Chapter Heading*

Of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), and confirmed in the extant sources. As already noted above, in E it is attached to the wrong chapter. The question type at issue is that of cause (διὰ τῆς). The categories concerned are 'being in a certain position' (κεῖσθαι) and quality.

D *Analysis*

a Context

The chapter, the fourth in the series of seven chapters dealing with the earth, is a sort of appendix to ch. 3.10, on the shape of the earth, or rather to 3.10.4–5, also with name-labels Leucippus and Democritus. What is presupposed here is an earth the shape of which is more or less flat. The chapter is parallel to ch. 2.8 on the tilting of the cosmos, where as a matter of fact the tilting of the cosmos

is related to that of the earth, as is entirely clear in 2.8.2 and implicit in 2.8.1, where the inhabited and uninhabited parts of the cosmos must be those of the earth.

b Number–Order of Lemmata

There are 2 lemmata, the order of which is determined by the relative chronology of the name-labels. The only doxai represented (S is lost) are of Presocratic and even purely Atomist origin. References to later views are absent and may have been lost.

c Rationale–Structure of Chapter

The rationale is determined by the relative chronology. The two in themselves rather peculiar doxai could also have been cited in the opposite order, since they pertain to exactly the same issue and the differences are not very big. Even so, it is worthy of note that this issue is represented by a slight diaphonia between the two early Atomists, a rather exceptional phenomenon illustrating the predilection of the doxographer for the exceptional.

Commentary

A *Witnesses*

The witnesses are P and his tradition, and S^L for a version of the heading. The heading is also found in Photius' index, so doxai from this chapter must have been present in the *Anthology*, but were removed by Byzantine epitomators. G omits the final doxa in his epitome.

P may have omitted a possible parallel chapter on the movement of the cosmos in Book 2, attested at T CAG 4.16, p. 104.15–17 καὶ οἱ μὲν μυλοειδῶς, οἱ δὲ τροχοῦ δίκην περιδινεῖσθαι (sc. the cosmos); cited above at *loci Aetiani*. The phrase οἱ μὲν σφαιροειδῇ τοῦτον εἶναι, οἱ δὲ ἑτεροειδῇ may be parallel to §3. See above the Appendix to ch. 2.2.

T is again absent.

B *Proximate Tradition and Sources*

(1) *Proximate tradition*. The proximate tradition is rather rich and quite interesting, e.g. among the *testes secundi* the *Scholia* on the *Hexaemeron* of Basil and in the *traditio proxima* Cicero and Hippolytus.

(2) *Sources*. Among the sources we may mention the discussion in Aristotle, *De caelo* 2.13, which as we have seen deals with those issues in relation to each other, namely substance and number, shape, position, and motion or rest, that are treated *more doxographico* separately in our chs. 3.9, 3.10, 3.11 and 3.13. His methodology (the diaeresis between those say that the earth is at rest and those who say that it moves) and terminology are also echoed.

C *Chapter Heading*

For S the heading has not been preserved in the main manuscripts of the *Eclogae* F and P, but it is attested in the *Index Photianus* and in S^L. Their wording, 'Whether the earth is at rest or moves', Πότερα μένει ἡ γῆ ἢ κινεῖται, differs from what is found in the tradition of P. As this version gives a more precise and detailed description of the contents of the chapter and moreover lists 'rest' and 'motion' in the order of appearance of these concepts in the lemmata, we have preferred it to the simpler Περί κινήσεως γῆς in P^{BGQ}, where it is of the umbrella type (περί τοῦ δεῖνα) that dominates in the *Placita* (see above, ch. 1.3 Commentary C). Note that the phrase 'On the earth's motion' is ambiguous in that it may also relate to earthquakes (see at ch. 3.15, Commentary D(c)). It is lost in P^E, so confirmation either way from this source is lacking.

D *Analysis*

a Context

This is the antepenultimate chapter of the block of seven chapters dealing with the earth. The question of the earth's rest or motion is one of the main issues in Aristotle's *De caelo* ch. 2.13, where it is discussed in connection with that of its position, substance and number, shape, and motion or rest, themes treated *more doxographico* separately in our chs. 3.9, 3.10, 3.11 and 3.13.

b Number–Order of Lemmata

P^B and P^G share three lemmata. The relative order is the same, which there is no reason to change. P^G omits the final doxa.

c Rationale–Structure of Chapter

The issue is motion or rest in the category of place (for motion in relation to all or some of the categories see ch. 1.23 Commentary C). In terms of doxai the main diaphonia is between §1, the earth at rest, and §§2–4, various sorts of movements of the earth. A third position is occupied by Xenophanes, perhaps representing the Eleatic Succession of which he is the archegete. These movements are listed according to a diaeresis that first opposes circular movement in space (§2) to circular movement about the axis (§3). §4 is a compromise lemma, appropriately located at the end, because it mentions both movement (at the beginning of the earth's career) and rest (its present situation). It is also rather odd, which appeals to our author and is a further reason for its final position; cf. for example Xenophanes' disappearing suns and moons in ch. 2.24.8. See further Mansfeld (1992a) at M–R 3.75–94.

In terms of name-labels the main contrast is between the majority (presumably the Ionic Succession beginning with Thales) and (representatives of) the Italic Succession, namely the Pythagoreans Philolaus and Ecphantus (plus Heraclides, because of his interest in Pythagoreanism), and Democritus, (an important representative of the Eleatic Succession). Cf. above ch. 3.11 Commentary D(c).

d Further Comments

General Points

The issue of the earth's motion returns in ch. 3.17, 'On earthquakes', *ubi vide*. This is because, as already noted above, the phrase 'the earth moves' is ambiguous, and can pertain both to the motion of the earth as a whole (around the centre of its system, or about its axis) and of the movement of only a part or parts, as during earthquakes.

Individual points

§2 The *Placita* again mention an individual, Philolaus, where Aristotle speaks of ‘the Pythagoreans’ in general; the doxa is already ascribed to him at ch. 3.11.3.

§3 There is no mention in this chapter of the heliocentric theory of Aristarchus of Samos, for which see ch. 2.24.7 (and e.g. Archimedes *Aren.* p. 135.8–18, Sextus Empiricus *M.* 10.174). The earth’s movement according to Heraclides and Ecphantus is axial rotation.

The proximate tradition represented by Cicero and Hippolytus mentions another Pythagorean, viz. not Ecphantus but Hicetas: this is another instance of a different attempt at identifying an individual where Aristotle spoke of a group.

e Other Evidence

The question of the earth’s motion (and position) was discussed widely, often vehemently, with the overwhelming majority being in favour of rest. The heterodox heliocentric view of Aristarchus was strongly condemned by Cleanthes as sacrilegious. The spectacle of the revolutions of the heavenly bodies about the earth was believed to produce the concept of God, see above, ch. 1.6, so Cleanthes’ reaction can be understood. Another variety of the earth’s motion, namely one about the axis that left it in place at the centre, was a minority position too. Because of the ambiguity of the expression ‘the earth moves’, the theme of the present chapter also plays a part in the chapter on earthquakes, 3.15 (for parallels also see above, *Loci Aetiani*).

The doxographies in Simplicius are unusual and interesting. They are not only based on the Aristotelian chapter (*Cael.* 2.13), but because of the inclusion of name-labels such as Heraclides and Aristarchus must also depend on the wider doxographical tradition.

The first three paragraphs of the chapter were quoted by Copernicus in the prefatory letter of the *De revolutionibus corporum coelestium*, so he presents the motion of the earth as a controversial issue. See Burkert (1972), 337 n. 1, and section E(b) General texts.

For an English translation of the Aëtian text see Volume 5.4

Commentary**A Witnesses**

Our only witness is P, represented here by P^B, P^G, P^{Sy} and P^Q, who have only a single lemma. A further lemma recorded by the same witnesses (except P^{Sy}) must be transposed here from ch. 3.11. See comments in sections D(b) and D(d) below. T is again absent.

B Proximate Tradition and Sources

(1) *Proximate tradition.* The proximate tradition in Ach, including his parallel for the Parmenides lemma (see below section D(c)), confirmed by a much

richer account in Strabo from which only a few abstracts can be printed below, demonstrates that far more material was available than is extant in our chapter (for which we also lack S' contribution). The ancient experts failed to agree about the number of zones, the mean difference being between the assumption of five (the majority) and that of six zones (Polybius; Posidonius according to Ach, and even more according to Strabo). The chapter originally may have contained more material than is extant in the tradition of P, who by omitting the alternatives in fact comes down in favour of five zones, just like Ach who states this explicitly.

(2) *Sources*. The issue is discussed by Aristotle *Mete.* 2.5 362a32–34, and largely paralleled in the wider tradition.

C Chapter Heading

P^B's long and precise version, rendering the category of quantity explicit (for which cf. Galen), is exactly parallel to the heading of its counterpart in the cosmological Book according to P^B, A 2.12 'On the division of heaven, in how many zones it is divided' (Περὶ διαίρέσεως οὐρανοῦ, εἰς πόσους κύκλους διαίρεῖται). P^{GQ} have a short umbrella version (περὶ τοῦ δεῖναι), of the type that dominates in the *Placita* (see above, ch. 1.3 Commentary C), as they also do at ch. 2.12, where we have some further evidence from S, who has a shorter heading in the way usual with this witness, as it combines two chapter headings, namely of chs. 2.11 and 2.12, and abridges them.

D Analysis

a Context

This chapter is the penultimate of the block of seven dealing with the earth proper, the last of which, ch. 3.15, deals with earthquakes.

b Number–Order of Lemmata

There are two lemmata in the chapter as restored. §1 gives a general account plus name-label; §2 adds a named doxa without the details of §1. We have followed Beck in placing the Parmenides lemma second because it is less general, and because misplacement is easier for a final lemma than for a first. See further below section D(d).

c Rationale–Structure of Chapter

The category is that of quantity (number). The rationale of the chapter may be gauged by its relation to ch. 1.2.12, which attributes the parallel division of the heaven into 'five belts or zones' to 'Thales Pythagoras and his followers', thus suggesting that the (standard) view is shared by the two Successions first listed

in ch. 1.3. In the present chapter only the name-labels of *ur*-numbers-person Pythagoras and of Parmenides are left. The proximate tradition at Ach c. 31, p. 50.1 states that Parmenides was the first to discuss the zones (of heaven as well as earth, one surmises), but fails to mention their number. Posidonius F 49 E.-K. = 13 Theiler at Strabo 2.2.2, 94C29–30 says that Parmenides mentioned five zones. Our lemma is explicit about this analogy between the division of the heaven and that of the earth, and so there is quite a bit of further evidence one would be in a position to quote.

d Further Comments

General Points

The zones are (1) the frigid zone north of the Arctic Circle, (2) the temperate zone between Arctic Circle and Tropic of Cancer, (3) the torrid zone between the Tropical Circles, (4) the temperate zone between Tropic of Capricorn and Antarctic Circle, and (5) the frigid zone south of the Antarctic Circle. See the informative Wikipedia article ‘Geographical Zone’.

Individual Points

§1 The text as transmitted is corrupt, but not desperately so. Diels’ restoration of the correct order of P’s five zones following P^G is now confirmed by P^Q. The formula μέση τῆς θερινῆς καὶ χειμερινῆς transmitted in line [6] was originally omitted in line [4] and put back in the wrong place, where it eliminated the word θερινή because it already contained τῆς θερινῆς. The word μέση, found both in line [4] and in line [6], gives the mechanism away: it was repeated *in margine* or in the tympanon (a reference symbol being attached) to show where the words τῆς θερινῆς καὶ χειμερινῆς should be inserted, but then the whole of this μέση plus τῆς θερινῆς καὶ χειμερινῆς was inadvertently inserted further down (Brinkmann’s law, see Brinkmann 1902). We do not have to follow Diels by rejecting the phrase ἡ δ’ οἰκητὴ ἐστὶν ἡ μέση τῆς θερινῆς καὶ χειμερινῆς, εὐκράτος τις οὖσα as a *glossema*. The reconstructed text merely provides standard information also available elsewhere.

The formula τῇ τοῦ παντός οὐρανοῦ σφαίρα in line [1] is paralleled in the first lemma of the above-mentioned counterpart of our chapter, ch. 2.12.1 (Pythagoras and his followers again): τὴν τοῦ παντός οὐρανοῦ σφαίραν, a reading accepted by all editors. Yet either παντός or οὐρανοῦ seems superfluous, and P^Q (for once shrewdly, or based on a better text) leaves out παντός both at ch. 2.12.1 and ch. 3.14.1. The phrase σφαίρα τοῦ παντός occurs rather often (six times, for instance, in Theon’s Commentary on Ptolemy), σφαίρα τοῦ οὐρανοῦ almost never, so P^Q or his Greek predecessor perhaps believed that οὐρανοῦ is a *glossema* on παντός. The ‘sphere of the All’, τῇ τοῦ παντός (σφαίρα), occurs again

in a Pythagorean context (name-label Philolaus) at ch. 2.4a.4 thanks to a good conjecture. With some misgivings we have followed the tradition of P^B and S, the latter at ch. 2.12.1 only.

§2 This lemma has been wrongly transmitted as the final one in P 3.11 and its corresponding chapter G 83. Beck already placed it here in 3.14, as Diels points out *ad loc.* in the app. (cf. also *DG* 62). Because this is a reconstruction of A, not a publication of P (as in Diels' left column in the *DG*, or in the editions of P by Mau and Lachenaud), we feel free to follow Beck's example.

The πρώτος εὑρετής ('first finder') motif is also frequently encountered elsewhere in the *Placita*, see M–R 2.1.95–96 and e.g. A 1.3.7, 1.3.17, and 2.1.1.

e Other Evidence

From the parallels quoted at section E(a) & (b), a collection of by no means all the available material, it follows that the information provided in our chapter is rather common. Extensive treatment is found in Ach cc. 29–31. For a detailed history of the development of the concept of the zones of a spherical earth see the excellent study of Abel (1974). It is interesting to compare Aristotle's tripartition of the inhabited world at *Pol.* 7 7.1327b18–38, which is similar to that of the Hippocratic *Airs Waters Places*.

E Further Related Texts

a Proximate Tradition

General texts: Strabo 2.2.1–3.3 (cf. Posidonius F 49 E.-K., 13 Theiler—far too long to quote, but see below). Isidore of Seville *Nat. Rer.* 10.1 *in definitione autem mundi circulos aiunt philosophi quinque, quos Graeci parallelos, id est zonas vocant, in quibus dividitur orbis terrae.*

Commentary

A *Witnesses*

The witnesses are P, represented by P^P (a large and important fragment of §§3–6 and §11), P^B, P^G and P^Q, with the heading only in P^L, P^{Ps} and P^{Sy}, and S. In S only the heading and the Plato lemma are extant, the other lemmata undoubtedly having been excised by the Byzantine editors. *Ecl.* 1.36 has been much abridged by the Byzantine copyists, for it only contains this Plato lemma and a long abstract from AD with name-label Aristotle; see M–R 1.202–203. T is again absent.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The relevant chapters in the ps.Aristotelian *De mundo* and above all Seneca's *Naturales quaestiones* Book 6 (originally Book 5), entirely devoted to earthquakes, provide a number of parallels. For the parallelism of the themes of chs. 3.3–7 + 14–15 + 4.1 with Lucretius' series at *DRN* 6.96–737 see Runia (1997) 97, and for details concerning parallels in the present chapter the pages in the Lucretius commentary of Ernout–Robin (1928) 3.270–283, 286–288. See also Bakker (2016) 104–105 and 135–136.

Williams (2012) 232–241, quot. 222, claims that Seneca's critical overview of doxai from Thales to Asclepiodotus on earthquakes has a built-in 'sub-plot of movement from visual perception of the world to an increasingly theoretical and abstract mode of engagement with its workings'. Thales' view that the earth 'moves' because it floats on water is based on a 'relatively uncomplicated, descriptive mode of analogy' (*ibid.* 233). Such a sub-plot is not found in A, where the 'primitive' analogies occur as late as §§8–9: 'floating' on water like pieces of wood according to Anonymi in §9, 'riding upon' air according to Anaximenes in §8. Another difference is that Seneca presents the doxai in a more or less chronological order (compare his not entirely strict procedure cited below ad ch. 4.1 Commentary B). Note however that he begins with a systematic summary at *Nat.* 6.5.1 before starting with Thales at 6.5.2.

(2) *Sources*. Passages in Aristotle's *Topics* and *Posterior Analytics* cited at section E(b) General texts show that the explanation of earthquakes was, understandably, an important topic, treatment of which according to him however left something to be desired. The subject is treated in *Mete.* 2.7, where the views of Democritus, Anaximenes and Anaxagoras are discussed in a systematic order (he also tells us *disertis verbis* what the chronological order is). The Anaximenes lemma (§3) derives from Aristotle's dialectical discussion; and so does the first Democritus lemma (§1), but not the second (§7). The resemblance between the Anaxagoras lemma (§5) and Aristotle's treatment is small. The Aristotle lemma is an abstract from *Mete.* 2.8. Sources for the lemmata and name-labels that have been added to these four are not known. For Aristotle the earth's cosmic motion is of course not a meteorological but a cosmological issue, see *Cael.* 2.13 and parallels and comments above, at ch. 3.13. Theophrastus(?) *Metarsiology* c. 15 provides a considerable number of parallels.

C Chapter Heading

The heading, of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), is attested in P, and for S in the index of Photius and S^L. It covers the question type of cause and the categories of place and action and passion.

D Analysis

a Context

This is the last of A's series of seven chapters on the earth. It is followed by two chapters on the sea, 3.16–17, which also belong with the πρόσγεια announced at ch. 3.8a, and by ch. 4.1 on the inundation of the Nile if (as we should) we discount P's misplaced ch. 3.18 (now reinstalled as A ch. 3.5a). In Aristotle earthquakes are discussed at *Mete.* 2.7–8, between *Mete.* 2.2–6 on winds and *Mete.* 2.9 on lightning and thunder etc. In the *Metarsiology* of Theophrastus(?), which does not deal with the sea, the chapter on earthquakes (here a meteorological phenomenon) comes last and follows upon that on the halo, which also contains the theological excursus. Epicurus discusses earthquakes (which can be caused in different ways, the first mentioned being κατὰ πνεύματος ἐν τῇ γῇ ἀπόληψιν) between *presteres* and winds at *Ep.Pyth.* at Diogenes Laertius *V.P.* 10.105–106. In Seneca *Nat. Book 6* (originally Book 5), on earthquakes, follows after Book 5, on winds (originally book 4), so (not deliberately, one suspects) remains faithful to the Aristotelian order. The location of the chapter in A is in the first place a consequence of the decision to discuss the earth in the meteorological section after the treatment of the atmospheric phenomena, see ch. 3.8. But note that Seneca, who does not include treatment of the earth

per se in his meteorology, includes earthquakes because of the role of ‘air’, or *pneuma*, in causing them, see *Nat.* 2.1.3 (Latin text cited below at section E(a) General texts): ‘How come’, you say, ‘that you included the study of earthquakes in the place where you were going to talk about thunder and lightning-bolts?’ ‘Because, since a quake is produced by breath, and breath is air set in motion, even if it goes beneath the earth, it should not be considered there: it should be examined in the place that nature allocated it.’ (trans. Hine). Bakker (2016) 136 argues that Book 3 preserves an original order (ch. 3.7 winds followed by ch. 3.15 earthquakes), provided one accepts that chs. 3.9–14 on the earth *per se* have been interpolated in between and ch. 3.8 on winter and summer is also seen as a later insertion.

b Number–Order of Lemmata

P, as represented by P^B and P^Q, has no less than 11 lemmata, 5 mutilated ones of which are preserved in P^P and only 4 are in P^G. S has merely 1 lemma, see above at section A for the reason. The sequence of name-labels shows that the order of lemmata is not chronological throughout. There is no ground for modifying P^{BQ}’s order, which to some extent is confirmed by P^P and G. This order is moreover confirmed by the rationale of the chapter, see immediately below at section D(c).

c Rationale–Structure of Chapter

Since the present chapter to an important extent derives from Aristotle’s treatment in the *Meteorology* (see above, section B), its combined treatment of ‘earthquake’ and ‘motion of the earth’ has been influenced by Aristotle’s vocabulary, who *Mete.* 2.7 365a14 announces his theme as ‘we must next speak of the quake and motion of the earth’, *περὶ δὲ σεισμοῦ καὶ κινήσεως γῆς μετὰ ταῦτα λεκτέον*. He tells us that Anaxagoras says that the air, when trapped in hollows below the earth, ‘moves it’ (*κινεῖν αὐτήν*), i.e. causes earthquakes, or shocks (365a18–21), while Democritus posits that it ‘is moved’ (*κινεῖσθαι*) by too much water in the hollows (365b1–2). The phrases ‘the earth moves’ or ‘the motion of the earth’ are ambiguous and can pertain both to its motion as a whole (around the centre of its system, or about its axis as in ch. 3.13 and in some lemmata of the present chapter), and of only a part or parts, as during earthquakes. *κινεῖσθαι* in §6 (twice), §7 and §10 pertains to cosmic movement, but in §9 and §11 to local movement, i.e. earthquakes, or shocks, tremors. In the *Placita* tradition this ambiguity was exploited, either on purpose or by mistake. Therefore also the earth’s rest became an issue here, as its ‘motion’ or ‘rest’ as a whole has still to be distinguished from these partial motions. This blending of cosmic and local motion is not, of course, beyond criticism. Part of the matter for ch. 3.13

may have ended up in ch. 3.15, in spite of the unambiguous chapter heading of 3.15. In §10 there is also some affinity with ch. 1.23, see below at section D(d)§10.

The chapter has three parts: the block §§1–5 are about earthquakes (and not about the earth in general); the block §§6–10 about the earth as being immobile qua cosmic body but being moved locally, i.e. also about earthquakes (note however that §8 does not mention them explicitly); and the single lemma §11, in a sense a continuation of §§1–5, again about earthquakes. The opposition between the two blocks is clear: (1) the first block lacks the movement of the earth qua cosmic body, and (2) the explanation of the earthquakes in the second block is different, since the elemental causal factors listed in the first are absent from it. The diaeresis or weak diaphonia that organises the lemmata in the first block focuses on the particular element or elements that cause the phenomenon: water/the wet in §§1–2, relative dryness/wetness in §3, air in §4, and hot/cold in §5. The second block also includes the cause of the earth's rest (or motion) qua cosmic body, providing unsophisticated as well as advanced explanations, in a rather curious order. §6 attributes a sophisticated view to (Aristotle's contemporary the Atomist) Metrodorus, resembling the doctrine of natural places and motions of Aristotle. This is followed by instances of the sophisticated doctrine well known as one of Anaximander and Plato (cited section E(b)§7), here (wrongly) attributed to Parmenides and Democritus at §7; it is also attributed to Plato at §10. But this sequence of related advanced doxai is interrupted by the unsophisticated pair §§8–9, doxai that at a first glance are to some extent opposed to one another. §8 only provides an explanation of the earth's rest, or at least fails to add one for earthquakes. §9 first gives the explanation of the earth's rest traditionally attributed to Thales but here assigned to Anonymi, then uses the same motive to explain its movement (*κίνησις*) in the sense of its being subject to earthquakes. So all is not well as to the arrangement of the lemmata, presumably because of the decision to cope with both general and local motions of the earth. The concluding §11, on the other hand, various explanations of the earth's local movements equally admitted by Epicurus, is fittingly placed at the end, as also occurs with similar Epicurean doxai at chs. 2.2.5, 2.4.13, 2.13.15, and 2.22.5.

d Further Comments *Individual Points*

§1 and §9 A separates the first name-label of the lemma, Thales, from the detailed explanation of earthquakes (cf. Seneca on Thales) he assigns to Anonymi in §9.

§1 and §7 The name-label Democritus occurs twice, the first time in relation to earthquakes only, the second also in relation to a mistakenly attributed explanation of the earth's immobility qua cosmic body.

§3 and §8 In a similar way as in §1/§9 (on Thales) Anaximenes' explanation of earthquakes in §3 is separated from the explanation of the earth's immobility in §8.

§6 'Proper place' (οἰκίῳ τόπῳ) and 'natural location' (κειμένην φυσικῶς) are Aristotelian or quasi-Aristotelian expressions and concepts, which surprise in relation to an Atomist. We may assume that the doxa has been reformulated in Peripatetic terms. The expression κειμένην φυσικῶς is not so easily paralleled, but cf. Aristotle *Cael.* 2.13 295b28–29 δῆλον ὅτι ἀναγκαῖον εἶναι τινα καὶ τῇ γῇ φύσει τόπον, and *Phys.* 4.5 212b33 μένει δὲ φύσει πᾶν ἐν τῷ οἰκίῳ τόπῳ. Also recall that according to Democritus the earth, after its initial wanderings, does come to a halt (A 3.13.4).

§7 For Democritus see at §1. The doubtful attribution of this view to Parmenides too (it fails to square with the verbatim quote 28B15a DK—from *Scholion in Basilium*, see above, *Testes secundi*—that 'the earth is rooted in water', Παρμενίδης ἐν τῇ στιχοποιίᾳ ὕδατόριζον εἶπεν τὴν γῆν) may be due to the attribution to him of a 'spherical earth in the middle' (28A1 DK at Diogenes Laertius *V.P.* 9.21, πρῶτος δὲ οὗτος τὴν γῆν ἀπέφαινε σφαιροειδῆ καὶ ἐν μέσῳ κείσθαι).

§8 See at §3.—Hall (1977) 427 points out: 'this is quite inaccurate: *Mete.* 2.8 does not mention ἀντιπερίστασις nor the natural lightness of dry exhalation'.

§9 See at §1.

§10 These directions of motion are subspecies of the species locomotion. One would have expected to find them in ch. 1.23, although the motions listed there according to number are different kinds of motion. The seventh subspecies of locomotion, i.e. that in a circle, which Plato in the *Timaeus* attributes to the heavens (see at section E(b)§10), is not mentioned here. This could have been attributed to the earth: axial motion. According to Aristotle *Cael.* 2.13 293b30–32 and Cicero *Luc.* 123, this is what Plato means at *Tim.* 40b–c (ἵλλομένην), while according to Theophrastus at Plutarch *Quaest. Plat.* 1006C (*Phys. Op.* fr. 22 Diels, 243 FHS&G) Plato in his old age repented, and wanted to attribute axial motion to the earth (see M–R 3.75–83). The present doxa implicitly denies this tradition and reading. Against the interpretation of Aristotle and Cicero cf. e.g. Alcinous *Did.* c. 15, 171.28–29 H. and Proclus in *Tim.* 3.137.6–7; see Steel (2009) 271–272.

§11 This is Epicurus' second and last appearance in the meteorological section (or his first see ch. 3.4.5), and the only time he is made to provide a multiplicity of causes for a meteorological phenomenon in Book 3. See Runia (2018) 402, 411. The evidence not strong enough to prove beyond all doubt an early version of *Placita* as source, though this is quite likely.

e Other Evidence

Earthquakes too, then as now much to be feared, are discussed rather widely. As noted above, important parallels are found in Aristotle and Seneca; we may also mention Pliny, Alexander of Aphrodisias, Ammianus Marcellinus, and quite a few of the other authors that usually provide parallels for the *Placita*. For the earth's cosmic movement see above, at ch. 3.13.

§1 Thales Democritus: Seneca Nat. 6.20.1–4 Democritus (68A98 DK) *plura putat. ait enim motum aliquando spiritu fieri, aliquando aqua, aliquando utroque, et id hoc modo prosequitur: 'aliqua pars terrae concava est; in hanc aquae magna vis confluit. ex hac est aliquid tenue et ceteris liquidius. hoc, cum superveniente gravitate reiectum est, inluditur terris et illas movet; nec enim fluctuari potest sine motu eius in quod impingitur.'* etiam nunc quomodo de spiritu dicebamus, de aqua quoque dicendum est: ubi in unum locum congesta est et capere se desiit, aliquo incumbit et primo viam pondere aperit, deinde impetu. nec enim exire nisi per devexum potest diu inclusa, nec in directum cadere moderate aut sine concussione eorum per quae vel in quae cadit. si vero, cum iam rapi coepit, aliquo loco substitit et illa vis fluminis in se revoluta est, in continentem terram repellitur, et illam, qua parte maxime pendet, exagitat. praeterea aliquando madefacta tellus liquore penitus accepto altius sedit, et fundus ipse vitatur. tunc ea pars premitur in quam maxime aquarum vergentium pondus inclinatur. spiritus vero nonnumquam impellit undas, et si vehementius institit, eam scilicet partem terrae movet in quam coactas aquas intulit. nonnumquam in terrena itinera coniectus et exitum quaerens movet omnia. et terra autem penetrabilis ventis est, et spiritus subtilior est quam ut possit excludi, vehementior quam ut sustineri concitatus ac rapidus. Nat. 6.7.1 quidam motum terrarum aquae imputaverunt, sed non ex eadem causa. Hippolytus Ref. 1.1.1 (on Thales, fr. 210 Wöhrle) ἀφ' οὗ (sc. τοῦ ὕδατος) καὶ σεισμούς.

§2 Stoics: Seneca Nat. 6.8.5 *habeant enim oportet (et) pluribus locis sparsum umorem, et in uno coactum, ut eructare tanto impetu possint. Diogenes Laertius VP. 7.154 (σεισμούς δὲ γίνεσθαι εἰσδύοντος πνεύματος) εἰς τὰ κοιλώματα τῆς γῆς ἢ καθειρχθέντος πνεύματος ἐν τῇ γῇ, καθά φησι Ποσειδώνιος (F 12 E.-K., 264 Theiler) ἐν τῇ η' (sc. του Φυσικοῦ λόγου): εἶναι δ' αὐτῶν τοὺς μέν σεισματίας, τοὺς δὲ χασματίας, τοὺς δὲ κλιματίας, τοὺς δὲ βρασματίας.*

§3 Anaximenes: Seneca Nat. 6.10.1 Anaximenes (cf. 13A21 DK) *ait terram ipsam sibi causam esse motus, nec extrinsecus incurrere quod illam impellat, sed intra ipsam et ex ipsa; quasdam enim partes eius decidere si aut umor resolverit aut ignis exederit aut spiritus violentia excusserit. sed his quoque cessantibus non deesse propter quod aliquid abscedat aut revellatur. etc. Hippolytus Ref. 1.7.8 (on Anaximenes, 13A7 DK) σεισμόν δὲ τῆς γῆς ἐπὶ πλεῖον ἄλλοιουμένης ὑπὸ θερμασίας καὶ ψύξεως. Ammianus Marcellinus 17.7.12 † Anaximander [12A28 DK; i.e. Anaximenes, cf. Capelle 1924, 363, DK p. 1.88 ad loc. and on 13A21 DK] *ait arescentem nimia aestuum siccitate aut post madores imbrum terram rimas pandere grandiores, quas penetrat supernus aër violentus et nimius, ac per eas vehementi spiritu quassatam cieri propriis sedibus. qua de causa tremores huius-**

modi vaporatis temporibus aut nimia aquarum caelestium superfusione contingunt.

§4 *Anaxagoras*: Seneca Nat. 6.9.1 (Anaxagoras 59A89 DK) *ignem causam motus quidam † et quidam non † iudicant, in primis Anaxagoras, qui existimat simili paene ex causa et aëra concuti et terram: cum ‹in› inferiore parte spiritus crassum aëra et in nubes coactum eadem vi qua apud nos quoque nubila frangi solent rumpit, et ignis ex hoc collisu nubium cursuque elisi aëris emicuit, hic ipse in obvia incurrit exitum quaerens, ac divellit repugnantia, donec per angustum aut nactus est viam exeundi ad caelum aut vi et iniuria fecit.* Nat. 6.12.1–2 *Archelaus* (60A16a DK—perhaps to be attributed to Anaxagoras, see below Amm. Marc.) ... *ita ait: ‘venti in concava terrarum deferuntur. deinde, ubi omnia spatia iam plena sunt, et in quantum aër potuit densatus est, is qui supervenit spiritus priorem premit et elidit, ac frequentibus plagis primo cogit, deinde proturbat; tum ille quaerens locum omnes angustias dimovet, et claustra sua conatur effringere. sic evenit ut terrae spiritu luctante et fugam quaerente moveantur. itaque cum terrae motus futurus est, praecedit aëris tranquillitas et quies, videlicet quia vis spiritus quae concitare ventos solet in inferna sede retinetur.’* Hippolytus Ref. 1.8.3–4 (on Anaxagoras, 59A42 DK) τὴν δὲ γῆν τῷ σχήματι πλατεῖαν εἶναι καὶ μένειν μετέωρον διὰ τὸ μέγεθος καὶ διὰ τὸ μηδὲν εἶναι κενὸν καὶ διὰ τὸ τὸν ἀέρα ἰσχυρότατον (4) ὄντα φέρειν ἐποχομένην τὴν γῆν. Ref. 1.8.12 (on Anaxagoras, 59A42 DK) σεισμούς δὲ γίνεσθαι τοῦ ἄνωθεν ἀέρος εἰς τὸν ὑπὸ γῆν ἐμπίπτοντος· τούτου γὰρ κινουμένου καὶ τὴν ὀχουμένην γῆν ὑπ’ αὐτοῦ σαλεύεσθαι. Diogenes Laertius V.P. 2.9 (on Anaxagoras, 59A1 DK) σεισμὸν ὑπονόστησιν ἀέρος εἰς γῆν. Ammianus Marcellinus 17.7.11 *aut certe* (sc. accidit), *ut Anaxagoras* (cf. 59A89 DK) *affirmat, ventorum vi subeuntium ima terrarum; qui cum soliditatibus con crustatis inciderint, eruptiones nullas repperientes eas partes soli convibrant, quas subrepserint tumidi. unde plerumque observatur terra tremente ventorum apud nos spiramina nulla sentiri, quod in ultimis eius secessibus occupantur.* Basil of Caesarea in Hexaem. 1.8, p. 15.15–19 Amand de Mendietta–Rudberg ἐάν τε γὰρ ἀέρα φῆς ὑπεστρώσθαι πλατεῖ τῆς γῆς, ἀπορήσεις, πῶς ἢ μαλθακὴ καὶ πολύκενος φύσις ἀντέχει ὑπὸ τοσούτου βάρους συνθλιβομένη, ἀλλ’ οὐχὶ διολισθαίνει πάντοθεν τὴν συνίζησιν ὑποφεύγουσα, καὶ αἰεὶ πρὸς τὸ ἄνω ὑπερχεομένη τοῦ συμπιέζοντος.

§5 *Aristotle*: Arius Didymus fr. 13 Diels at Stob. Ecl. 1.36.2, pp. 249.12–251.27 Wachsmuth Ἀριστοτέλης φησὶ σεισμούς γίνεσθαι καὶ μυκήματα καὶ χάσματα τῆς ξηρᾶς ἀναθυμιάσεως εἰς τὰς ἀραιότητας κατὰ τῆς γῆς ρύσεως καὶ κατὰ τὰς ἀθρόας ἐμπτώσεις τρόμους καὶ βρασμούς περὶ αὐτὴν ἀπεργαζομένης. ὥς γὰρ ὁρμήσασαν ἔξω τὴν ἀναθυμίασιν ἄνεμον ποιεῖν σφοδρόν, οὕτως εἴσω καθερχθεῖσαν τῇ ῥύμῃ τῆς φορᾶς διακραδαίνειν τοὺς τόπους, ἐν οἷς ἂν ἀποληφθῇ. συνέχεσθαι (δὲ) τὴν δύναμιν αὐτὴν ἐν τῇ γῇ διὰ τε πύκνωσιν τῆς ἐπιφανείας καὶ διὰ κατάψυξιν καὶ διὰ ξηρασίαν. κτλ. Ammianus Marcellinus 17.7.11 *accidunt autem, ut opiniones aestimant, inter quas Aristoteles aestuat et laborat, aut in cavernis minutis terrarum, quas Graece syringas appellamus, impulsu crebriore aquis undabundis.*

§6 **Metrodorus: Seneca Nat.** 6.19.1 *Metrodorum Chium* (70A21 DK) ... *audiamus ... quid ergo dicit? 'quomodo, cum in dolio cantatur, vox illa per totum cum quadam discussione percurrit ac resonat, et tam leviter mota tamen circumit non sine tactu eius tumultuque quo inclusa est, sic speluncarum sub terra pendentium vastitas habet aëra suum, quem, simul alius superne incidens percussit, agitat, non aliter quam illa de quibus paulo ante rettuli inania indito clamore sonuerunt'.*

§7 **Parmenides Democritus: Basil of Caesarea in Hexaem.** 10, p. 17.11–16 Amand de Mendieta–Rudberg ἤδη δέ τινες τῶν φυσικῶν καὶ τοιαύταις αἰτίαις τὴν γῆν ἀκίνητον μένειν κατακομφεύονται. ὡς ἄρα διὰ τὸ τὴν μέσσην τοῦ παντὸς εἰληφέναι χώραν, καὶ διὰ τὴν ἴσσην πάντοθεν πρὸς τὸ ἄκρον ἀπόστασιν, οὐκ ἔχουσιν ὅπου μᾶλλον ἀποκλιθῇ, ἀναγκαίως μένειν ἐφ' ἑαυτῆς, ἀδύνατον αὐτῇ παντελῶς τὴν ἐπὶ τὴν ῥοπήν τῆς πανταχόθεν περικειμένης ὁμοιότητος ἐμποιοῦσης.

§§8–9 **Anaximenes and Others: Basil of Caesarea in Hexaem.** 1.8, p. 15.13–16.5 Amand de Mendieta–Rudberg μὴδὲ ἐκεῖνο ζητεῖν παραινῶ, ἐπὶ τίνος ἔστηκεν. ἰληγιάσει γὰρ καὶ οὕτως ἡ διάνοια, πρὸς οὐδὲν ὁμολογούμενον πέρας διεξιόντος τοῦ λογισμοῦ. ἐάν τε γὰρ ἄερα φῆς ὑπεστρώσθαι πλάτει τῆς γῆς, ἀπορήσεις, πῶς ἡ μαλθακὴ καὶ πολύκενος φύσις ἀντέχει ὑπὸ τοσοῦτου βάρους συνθλιβομένη, ἀλλ' οὐχὶ διολισθαίνει πάντοθεν τὴν συνίζησιν ὑποφεύγουσα, καὶ αἰεὶ πρὸς τὸ ἄνω ὑπερχεομένη τοῦ συμπιέζοντος. πάλιν, ἐάν ὑποθῇς ἑαυτῷ ὕδωρ εἶναι τὸ ὑποβεβλημένον τῇ γῇ, καὶ οὕτως ἐπιζητήσεις, πῶς τὸ βαρὺ καὶ πυκνὸν οὐ διαδύνει τοῦ ὕδατος, ἀλλ' ὑπὸ τῆς ἀσθενεστεράς φύσεως τὸ τοσοῦτον ὑπερφέρον τῷ βάρει κρατεῖται· πρὸς τὸ καὶ αὐτοῦ τοῦ ὕδατος τὴν ἔδραν ἐπιζητεῖν, καὶ πάλιν διαπορεῖν τίνι στεγανῷ καὶ ἀντερείδοντι ὁ τελευταῖος αὐτοῦ πυθμὴν ἐπιβαίνει. cf. **Ambrose of Milan Exam.** 1.6.22, p. 18.7–11 Schenkel *quid nobis discutere utrum in aëre pendeat an super aquam, ut inde nascatur controversia, quomodo aëris natura tenuis et mollior molem possit sustentare terrenam aut quomodo, si super aquas, non demergatur in aquam grauis terrarum ruina?*

§8 **Anaximenes: ps.Plutarch Strom.** 3 (Anaximenes 13A6 DK) πιλουμένου δὲ τοῦ ἀέρος, πρῶτην γεγενῆσθαι λέγει τὴν γῆν, πλατεῖαν μάλα· διὸ καὶ κατὰ λόγον αὐτὴν ἐποχεῖσθαι τῷ ἀέρι. **Hippolytus Ref.** 1.7.4 (on Anaximenes, 13A7 DK) τὴν δὲ γῆν πλατεῖαν εἶναι, ἐπ' ἀέρος ὀχουμένην. **Basil of Caesarea in Hexaem.** 1.8, p. 15.15–19 see above at §4. **Ambrose of Milan Exam.** 1.6.22, p. 18.13–15 Schenkel *multi etiam in medio aëris terram esse dixerunt et mole sua immobilē manere, quod aequabili motu hinc atque inde ex omni parte protendat.*

§9 **Others: Lucretius DRN** 6.552–556 *fit quoque, ubi in magnas aquae vastasque lacunas / gleba vetustate e terra provolvitur ingens, / ut iactetur aquae fluctu quoque terra vacillans, / ut vas inter (aquas)* [coni. Martin, alii alia] *non quit constare, nisi umor / destitit in dubio fluctu iactarier intus.* **Seneca Nat.** 3.14.1 *Thaletis* (11A15 DK) *inepta sententia est. ait enim terrarum orbem aqua sustineri et vehi more navigii mobilitateque eius fluctuare tunc cum dicitur tremere.* **Nat.** 6.6.1 *in aqua causam esse nec ab uno dictum est nec uno modo. Thales Milesius (fr. 101 Wöhrle) totam terram subiecto iudicat umore portari et innare, sive illud Oceanum uocas, seu magnum mare, sive alterius naturae sim-*

plicem adhuc aquam et umidum elementum. 'hac' inquit 'unda sustinetur orbis velut aliquod grande navigium et grave his aquis quas premit'. see also above on §1.

§10 **Plato: Philo Leg.** 1.4 ἐξαχῇ γὰρ τὸ ὀργανικὸν σῶμα πέφυκε κινεῖσθαι, πρόσω καὶ κατόπιν, ἄνω καὶ κάτω, ἐπὶ δεξιὰ καὶ εὐώνυμα. *Somn.* 1.26 ὅτι τὸ σῶμα ... ἐξαχῇ κινήτον, ἴσμεν, ... κινήσεις δὲ τὰς διπλασίας ἔξ, τὴν ἄνω, τὴν κάτω, τὴν ἐπὶ δεξιὰ, τὴν ἐπὶ εὐώνυμα, τὴν πρόσω, τὴν εἰς τὸ κατόπιν. **Simplicius in Cael.** 520.30–521.1 πέμπτον τῶν τὴν ὁμοιότητα καὶ τὴν ἰσορροπίαν αἰτίαν τῆς μονῆς λεγόντων, ὡς Ἀναξίμανδρος (fr. 187 Wöhrle) καὶ Πλάτων (*Phd.* 108e–109a).

§11 **Epicurus: Epicurus Ep.Pyth.** at D.L. 10.105–106 σεισμούς ἐνδέχεται γίνεσθαι καὶ κατὰ πνεύματος ἐν τῇ γῇ ἀπόληψιν καὶ παρὰ μικροῦς ὄγκους αὐτῆς παρὰ-θεσιν καὶ συνεχῇ κίνησιν, ὃ τὴν κράδανσιν τῇ γῇ παρασκευάζει. καὶ τὸ πνεῦμα τοῦτο ἢ ἔξωθεν ἐμπεριλαμβάνει (ἢ) ἐκ τοῦ πίπτειν [εἰς] ἐδάφη εἰς ἀντροειδεῖς τόπους τῆς γῆς ἐκπνευματοῦντα τὸν ἐπειλημμένον ἀέρα. (καὶ) κατ' αὐτὴν δὲ τὴν διάδοσιν τῆς κινήσεως ἐκ τῶν πτώσεων ἐδαφῶν πολλῶν καὶ πάλιν ἀνταπόδοσιν, ὅταν πυκνώμασι σφοδρότεροις τῆς γῆς ἀπαντήσῃ, ἐνδέχεται σεισμούς ἀποτελεῖσθαι. (106) καὶ κατ' ἄλλους δὲ πλείους τρόπους τὰς κινήσεις ταύτας τῆς γῆς γίνεσθαι. **Lucretius DRN** 6.535–542 *nunc age, quae ratio terrai motibus extet / percipe. et in primis terram fac ut esse rearis / sup(er) item ut supera ventosis undique plenam / speluncis multosque lacus multasque lacunas / in gremio gerere et rupes deruptaque saxa; / multaue sub tergo terrai flumina tecta / volvere vi fluctus summersaque saxa putandumst; / undique enim similem esse sui res postulat ipsa.* **DRN** 6.591–593 *quod nisi prorumpit, tamen impetus ipse animai / et fera vis venti per crebra foramina terrae / disperitur ut horror, et incutit inde tremorem.* **Seneca Nat.** 6.20.5–7 *omnes istas esse posse causas Epicurus (fr. 351 Usener) ait, pluresque alias temptat, et illos qui aliquid unum ex istis esse adfirmaverunt corripit, cum sit arduum de his quae coniectura sequenda sunt aliquid certi promittere. (6) 'ergo' ut ait 'potest terram movere aqua si partes aliquas eluit et adrosit, quibus desiit posse extenuatis sustineri quod integris ferebatur. potest terram movere impressio spiritus: fortasse enim aër extrinsecus alio intrante aëre agitur, fortasse aliqua parte subito decidente percutitur, et inde motum capit. fortasse aliqua pars terrae velut columnis quibusdam ac pilis sustinetur, quibus vitiatis ac recedentibus tremit pondus impositum. (7) fortasse calida vis spiritus in ignem versa et fulmini similis cum magna strage obstantium fertur. fortasse palustres et iacentes aquas aliquis flatus impellit, et inde aut ictus terram quatit aut spiritus agitatio ipso motu crescens et se incitans ab imo in summa usque perfertur.' nullam tamen illi placet causam motus esse maiorem quam spiritum.*

Commentary

A *Witnesses*

The witnesses are P, represented by P^P, P^B, P^E, P^G, P^Q, and (for a version of the heading only) P^S. Small snippets of the text are preserved in P^P, the Antinoopolis papyrus. For S only an abridged version of the heading is extant in the Index of Photius and in S^L; the lemmata of S are lost, again excised by the Byzantine editors. T is again absent as well.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The proximate tradition as represented by the usual authors consists of a heading and a general note in Pliny, a general remark in Eusebius, phrases in Lucretius and Hippolytus; there is also a relevant passage in Basil of Caesarea.

(2) *Sources*. The issue itself and three of the six lemmata, viz. §1, §3, and §5 derive (virtually unchanged!) from Aristotle's treatment in *Mete.* 2.1–2, so we do not have to derive these doxai from Theophrastus' *Physikai Doxai*. Aristotle does not provide name-labels the first time he lists them, though subsequently he identifies the second doxa as that of Empedocles (paralleled in §3), and he includes Democritus among the representatives of that of §1. But he does not identify Anaximander among the proponents of the first doxa. The ascription to Theophrastus (*Phys.Op.* fr. 23 Diels, Theophrastus fr. 221 FHS&G, cited below section E(b) general texts), whose name is cited, of a section in Alexander's in *Meteorologica* commenting on Aristotle's overview should not be extended beyond the phrases printed in spaced letters (*Sperrdruck*) by Diels, who correctly points out, *DG* 494 ad loc.: 'operae pretium erit Aristotelem exemplum conferre, cuius pleraque paraphrasis esse videntur'; see further Mansfeld (2013a) 339. It is not clear from what Theophrastean work Alexander's quotation has been taken, for Alexander does not cite the title. The treatise *On Waters* is the most plausible candidate (Sharples, loc. cit., mentions the Περὶ τῶν φυσικῶν δοξῶν, i.e. the *Physikai Doxai*). Alexander in *Sens.* 71.24–72.4 (fr. 212 FHS&G) cites the title *On Waters* in another context, where he gives us Theophrastus' explanations for brackishness because of having filtered through a certain type of earth, or bitterness for having filtered through ashes.

What is clear is that the Aëtian name-label Anaximander in §1 is confirmed by Theophrastus, who also mentioned Diogenes (of Apollonia), not paralleled in A at P here. Possibly also the name-labels Empedocles, Anaxagoras, Metrodorus (all of which are paralleled in A at P), and Archelaus (not Anaxagoras, as Alexander writes) were mentioned by Theophrastus, since, as we saw above, only 'Empedocles' and 'Democritus' are named in Aristotle's account. That Alexander remembered them from another doxography is less likely (*fontes non sunt multiplicandi praeter necessitatem*), but cannot be excluded.

Hippolytus (*Ref.* 1.14.4) mentions both Xenophanes and Metrodorus; only the latter is paralleled in Theophrastus and §5, while a doxa that differs from that of Metrodorus is ascribed to Xenophanes. Diels *DG* 153 hypothesizes that the two name-labels plus doxai have been ultimately abstracted from 'Theophrasti *Opiniones*', and it is indeed likely that a chapter in a cousin writing of A comprised more information, as is also suggested by the fragmentary contents of Pap. Pack² 1499, which seem to be parallel to §§1, 3 and 5, cf. section D(e) below and section E(a) General texts.

The intermediary sources for §2, §4 and §6 are not known.

C Chapter Heading

The long version as in P^B is a combination of the standard umbrella formula (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3 Commentary C), and a further indication of the subjects treated. It should be maintained, because it clearly echoes Aristotle's announcement of the subject at *Mete.* 2.1. πῶς is used twice, and the two themes indicated by this adverb are interrelated. Among the *Placita* headings beginning with Πῶς or containing πῶς a little later there are several with the formula πῶς γίνεται (or γίνονται), see at ch. 1.4 above, Commentary C. We are dealing with a problem (i.e. ζητεῖται πῶς, a formula already used by Aristotle), and looking for a causal explanation (question type).

D Analysis

a Context

This is the first of the two chapters dealing with the terrestrial waters that conclude the treatment of the πρόσγεια announced at ch. 3.8.2. It is followed by ch. 3.17, on tides, and (if we recognise that P ch. 3.18 = A ch. 3.5a has not been transmitted in the right place in ps.Plutarch) by a third chapter, 4.1 on the Nile, which appears to have finished up in the wrong Book.

In Aristotle the origin and salinity of the sea are discussed at *Mete.* 2.1–3, after 1.13–14, on (winds,) rivers, and changes in the distribution of sea and land, and before 2.4–6, on winds. The order in the *Placita* is more rigorous. In Pliny's *Naturalis historia* the chapters on the salinity of the sea (2.222–223) are preceded by those on the tides (2.212–221), while in A the order is the opposite: salinity first (3.16), then tides (3.17).

b Number–Order of Lemmata

There are six lemmata. The relative order of §1, §3 and §5 exactly corresponds to the relative order of the (anonymous) doxai at Arist. *Mete.* 2.1 353b5–16, cited below at section E(b)§§1,3,5. Of the doxai not paralleled in Aristotle that at §2, name-label Anaxagoras, pertains to the desiccation of the original moisture and resembles the doxa attributed to Anaximander in §1, while that at §4, name-label Antiphon, pertains to sweat, just as the doxa of Empedocles in §3. They are varieties of the preceding doxai, as is the case more often with couplings of doxai in the *Placita*. Accordingly the order of §§1–5 is determined by the original order of the doxai of §1, §3, and §5 in Aristotle. This leaves the final position for the doxa with name-label Platonists at §6. There is accordingly no reason to modify the order of A at P, also preserved by Diels in the *DG*.

c Rationale—Structure of Chapter

We may discern a systematic rationale in the sequence of explanations of the sea's salinity through desiccation (§§1–2), as sweat (§§3–4), or by admixture (§5). The final lemma, §6, is different, as it not only provides an explanation for the salinity of the sea through the evaporation of elemental water from the earth by means of heat and burning, but also explains how sweet elemental water is produced from air by cooling and compression. Accordingly the main diaphonia that can be discerned in the sequence is between §§1–5, which presuppose (as in Aristotle's reportage) a coming to be but also a passing away of the sea, and §6, which implies that the processes of evaporation and condensation are everlasting.

d Further Comments

Individual Points

§2 Seawater is believed to be fatty, as the salt contains oil, see ps.Aristotle *Probl.* 23.7 932b4–6, 'or is it because the sea is oilier (λιπαρωτέρα ἢ θάλαττα)?'; *Probl.* 23.9 932b18, 'for there is something oily in salty juice' (λιπαρὸν γὰρ ἔνεστιν ἐν τῷ ἁλμυρῷ χυμῷ); *Probl.* 23.15 933a17–20, 'why does the sea burn whereas water does not? Or does the latter too burn, whereas the sea is able to extinguish fire because it is oilier? And there is a sign that it is oilier: for oil is extracted from salt' (σημεῖον δὲ ὅτι λιπαρωτέρα· ἀπὸ γὰρ τῶν ἁλῶν ἔλαιον ἀφαιρεῖται)—all trans. Mayhew (2011a). Also see *Probl.* 32 935.5–9, cited below section E(b)§2. Cf. Plutarch *Quaest. Conv.* 627C, 'that (the sea) is oily Aristotle has said himself'; *Aet. Phys.* 911E 'the sea partakes of a lot of fatness'.

§6 This theory of evaporation and condensation is well known as one of Aristotle, see *Mete.* 1.9 346b16–347a12, 2.4 359b34–360a17; cf. Laks (1997) 241 n. 16 = (2007) 32 n. 15. It is not easy to understand why it came to be attributed to the followers of Plato, though of course Aristotle is one, in a way.

e Other Evidence

An extremely important text has been (poorly) preserved on an early papyrus, *PPack*² 1499, third cent. BCE, quoted section E(a) General texts: Three positions on the salinity of the sea are distinguished, and the overview is introduced by a word that Diels reconstructed as <διαφωνί>α but for which we, more cautiously, propose the Aristotelian <ἐναντιολογί>α. The result is the same, namely an explication of the kind of diaeresis or diaphonia characteristic of Peripatetic dialectic and later doxography. The positions listed there belong to 'some', 'others', and 'Democritus'. Diels, reconstructing the doxai *ad probabilem sententiam*, had recourse to Aristotle *Mete.* 2.1–3. The name-label Democritus, not found (or at least not extant) in the present chapter, is indeed found in

this context at Aristotle *Mete.* 2.3 356b10–11. Diels printed the papyrus text among the testimonia in the Democritus chapter of the *Fragmente der Vorsokratiker*. Curiously enough it has not been realized that it constitutes one of the rare instances of evidence intermediate between Aristotle and the *Placita*. Because of its early date it is even more exceptional than the Chrysippean parallel for ch. 4.5 (where see at Proximate tradition). The text has been attributed to Theophrastus. Funghi and Sassi at Adorno & *alii* (1999) 844ff. suggest it derives from his *On Waters*, though with a question mark; cf. also Sharples (1998) 219–220, with references. It is indeed far from certain that it is Theophrastean.

Commentary

A Witnesses

The witnesses are P, represented by P^B, G, Q, P^L, by P^{PS} for the heading, and S. §§2–4 and 6–9 have been omitted in the abridged chapter in S^{FP}, but are

preserved in the Florentine florilegium S^L. For this abridgement, typically only preserving doxai of Plato and Aristotle (and in this case also of Heraclides Ponticus), see M–R 1.202–203. The matching lemmata in the full text of S and that of P are presented in the same order. It appears that S must have written out the entire chapter. Préaux (1973) 104–107 fails to realize that P, G and S represent the same source. For P^{PS} see M–R 1.171 n. 163. T is again absent.

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* As the tides became an object of scientific questioning rather late in the day, the proximate tradition is rather late too, and mainly found in Strabo, who mentions Seleucus, Posidonius, Athenodorus (i.e. A. Calvus), and others. Posidonius devoted much attention to the subject, FF 214–221 E.–K., see examples below at section E(a)§§1,4,9.

(2) *Sources.* The tides are not treated in Aristotle's *Meteorology*, as he was not aware of their importance. For Aristotle's scattered references to the issue, which became relevant only by hindsight, see below, section D(d)§1. Theophrastus' (?) *Metarsiology* does not deal with the tides either. The intermediary sources for the specialized scientific information are unknown.

Préaux (1973) 20–21, 103–115 provides an instructive overview against a wider background including translated passages. Also see Duhem (1914) 267–390 (ch. xiii. 'la théorie des marées et l'astrologie').

C *Chapter Heading*

The quite specific and detailed heading is attested in the witnesses with only minor variations. For *Placita* headings beginning with Πῶς (indicating search for a cause (διὰ τῆς)) so dealing with this question type, cf. αἰτίαι in §2) or having πῶς a little later see at ch. 1.4 above, Commentary C. The category of place is also at issue here.

D *Analysis*

a Context

'Ursprünglich sind die Gezeiten deswegen in der Meteorologie behandelt worden, weil die Winde mitzuwirken schienen' according to Theiler (1982) 2.205. Since the tides are not treated in Aristotle's *Meteorology*, this perceptive remark does not apply to his treatise. Chs. 3.16 and 3.17 on the sea are incorporated in the meteorological Book of the *Placita* because the sea belongs with the πρὸς-γεια announced at ch. 3.8. What is true is that the role of the winds (*pneumata*) in §1, §4 and §9 (as of *pneuma* in causing and so explaining earthquakes in ch. 3.15, where see at Commentary D(a)) contributes to the present inclusion of these matters in the meteorology. For the position of an account of winds cf.

ch. 3.7 above, at Commentary D(a). In Pliny's *Naturalis historia* the chapters on the tides (2.212–221) are followed by those on the salinity of the sea (2.222–223), while in A the order is the opposite: first salinity (ch. 3.16), then tides (ch. 3.17).

If we discount ch. 3.5a, which we believe to have been transmitted in the wrong place in P as p. 3.18, the two chapters on the sea, 3.16–17, are immediately followed beyond the Book division by another chapter on terrestrial waters, ch. 4.1 on the river Nile. And just as ch. 3.17 deals with the high and low waters of the sea (perhaps not only during a twenty-four-hours period but also in summer and winter), so ch. 4.1 deals with the high and low waters in summer and winter of an exceptional river.

We also note another link between chs. 3.17 and 4.1, namely the presence of name-labels and further qualifications that do not, or only exceptionally, occur elsewhere in the *Placita* (see further at ch. 4.1, Commentary D(a)). Pytheas (to be dated between c. 350–300 BCE) occurs only here, in §3 (G has another and earlier Massaliot, Euthymenes, presumably because of a confusion with ch. 4.1.2 via the ethnicon). Timaeus occurs in §6 with his ethnicon (the latter in S, not in P), and further down, in ch. 5.15.2, without it. Crates plus occupation occurs in §7 (in S only, name-label repeated in §9, also only in S), and in ch. 2.15.6 (in P not S) without occupation. The Apollodorus of §9 (S only) never occurs elsewhere. Seleucus occurs at §7 and at ch. 2.1.7 (where without ethnicon in P, with it in S). So in no less than 6 of the 9 lemmata of ch. 3.17 the name-label is followed by a further specification: the ethnicon four times, namely §2 Μεσ(σ)ήνιος, §3 (δ) Μασσαλιώτης, §6 ὁ Ταυρομενίτης, and §8 ὁ Κερκυραῖος, and twice a professional qualification, namely §7 ὁ γραμματικός, and §9 ὁ μαθηματικός. In ch. 4.1, for which S is lost, we still have, in P 4.1.2, 'Euthymenes the Massaliote', in 4.1.5 'Herodotus the writer', and in 4.1.6 'Ephorus the historian'. Both our chapters, 3.17 and 4.1, contain rare names and professions of a rather special kind: the explorers Euthymenes and Pytheas, the historians Herodotus, Ephorus and Timaeus, Crates, a man of letters, Seleucus, an astronomer (astronomers are encountered more often in the *Placita*), and Apollodorus of Corcyra about whom nothing more is known. This 'Apollodoran' parallel is a point in favour of accepting an otherwise unknown Euenius at A 3.17.2 (see however below, section D(d)§2). But Dicaearchus is also acceptable, because this would be the first time he is mentioned in the *Placita*, so the ethnicon would have been used to introduce him in the proper way.

b Number–Order of Lemmata

See above section A.

P^B has five lemmata, of which P^G has copied out three and P^L also three (but of these P^G and P^L only share two, viz. §1 and §3). P^Q has 4 lemmata, so has lost

one. S has nine lemmata, five of which coincide with the lemmata of P. In P and S the lemmata are arranged in the same relative order. Accordingly, like Diels in the *DG*, we have preserved this sequence, also because there is no reason to interfere in view of the rationale.

c Rationale–Structure of Chapter

As the heading already shows the chapter is concerned with the question type of cause, the διὰ τί, then of course also with the category of place. The lemmata order is not chronological. A first opposition is between §§1–2, on the sun as the cause of the tides, and §§3–4, on the moon as their cause. §1 sun via winds is also opposed to §4 moon via winds. §§1–4 together, which speak of celestial bodies as the cause, are opposed to §§5–8, which posit watery causes: oscillating terrestrial waters (§5), rivers falling into and withdrawing from the Ocean (§6), a mysterious push and pull of the sea (§7), and equally mysterious refluxes from the Ocean. We also have a succession of elements: heavenly fire, airs, waters, earth in more or less descending order. The final lemma, §9, is close to §§3–4 in positing the moon as cause and to §1 and §4 in adding the wind, while it is also related to §§5–8 in attributing a role to the sea itself. So §9 has it both or even more than both ways, and is appropriately arranged last as being the compromise position and also because, exceptionally in this chapter—which would not have been the case in ch. 3.15—‘Seleucus, *too*’ (καὶ σὺ, τέκνον), moves the earth. To prove, or to claim, that the earth moves always was a minority position in Antiquity, whether this was said to happen by rotation or by revolution or by both. The theory of the present lemma only needs the axial rotation (see below at section D(d)§9).

d Further Comments

Individual Points

§1 Aristotle did not discuss or try to explain the tides of the sea. His experience was limited to the Mediterranean, where (with the exception of the Adriatic) the tides are insignificant. Unsurprisingly, the present doxa concerned with the tides of the *Atlantic* cannot be paralleled from the *pragmateiai*, where Ἀτλαντικός (plus a word for sea) never occurs (a single occurrence in Theophr. *Vent.* 38, and four in the *De mundo*). There is, however, a remarkable passage at *GA* 4.10 777b17–778a2 (cited at section E(b)§1), where he argues that the periodicities of the sun and moon (i.e. ‘day and night and month and year’ etc.) determine what is ‘of inferior standing’: ‘the sea ... is settled or is moved according as the winds are at rest or in motion, while the behaviour of the air and the winds in turn depends on the period of the sun and moon’ (tr. Peck, LCL). *Mete.* 2.1 354a5–11 (also cited at section E(b)§1) contrasts the clearly visible flow and swaying

backwards and forwards of the sea in straits with that of the open sea, where this movement is unnoticeable—an obvious reference not to the Atlantic but to the virtually tideless Mediterranean. Lee ad loc. (in the LCL *Meteorology*) remarks that '[i]t is not clear what Aristotle means by this ebb and flow (lit. swinging to and fro [sc. this *ταλαντεύεσθαι δεῦρο κακέισε*]) of the sea, for he had no real knowledge of the tides'. But in the *GA* passage Aristotle goes further, adducing the movements of the winds and the air that set the sea in motion as determined by the regular movements of the heavenly bodies, esp. sun and moon. But this is a postulate rather than an explanation, although later readers may have felt justified in believing that Aristotle here really alluded to the tides as described and explained by later authorities.

According to Strabo Aristotle was criticized by Posidonius for making the coasts of Morocco and Spain the cause of the tides, the headlands catching the waves and hurling them back (see at section E(b)§1). This is not attested in the *pragmateiai* either (*Mete.* 2.1 345a6–12, cited by Pajón Leyra 2013, 727 and others, is not about coastal seas but about straits). As Kidd (1988) 791 points out, Posidonius may have transferred Aristotle's remark about the straits of the Mediterranean to the Atlantic. (Compare his account of what happens when winds are forced from a wide into a narrow place such as gates or a (hollow) road, *Mete.* 3.1 370b18–27). It is rather ironic that the doubtlessly apocryphal story of his death as reported by Procopius (cited at section E(b)§1) has him die a difficult death because he realized his failure to find an explanation for the currents in the Euripus.

We note in passing that Reinhardt, who (1921) 123 briefly discusses our chapter, accepts the information in §1 as valid for Aristotle, thus sinning against his own principle that doxographical passages containing a name-label should be distrusted, and omitting to take Aristotle's own works into account.

§2 'Dicaearchus etiam 4.2.7 et 5.1.4 magistrum sequitur', thus Diels *DG* ad loc., though two years later he changed his mind as to the correct restoration. For the *constitutio* we have followed the recent editors of and commentators on the fragments of Dicaearchus, but are far from certain that the attribution is right. To be sure, against Elter (who refers to Εὐήνιος in Photius' index cod. 167 p. 114a36) and Wachsmuth one may argue that ms. ***ηγνιος may well be a duplicate of Μεσήνιος rather than the other way round. This Euenius moreover is not known from elsewhere. And Photius is not infallible! Though the name-label Dicaearchus occurs at chs. 4.2.7 and 5.1.4, he fails to list it in his overview of names. On the other hand the Peripatetic Dicaearchus follows on well after Aristotle and Heraclides (who is often associated with the Peripatos), and the rather unclear doxa ascribed to him is a variety of that of his two predecessors cited in the previous lemma.

§3 In a note to his account of the tides in his *Physische Geographie* (first published by F.Th. Rink in 1802) Kant wrote: ‘According to the report of Plutarch, Pytheas of Massilia was the first to refer the tides to the revolutions of the moon, and had there not been such a great discrepancy between the mere perception that something was thus and the proof that it was necessarily so and could not be otherwise, it would have been amazing that Newton was the first to demonstrate the truth of this observation.’ Trans. by O. Reinhardt quoted from E. Watkins ed., *Immanuel Kant: Natural Science*, Cambridge (2012), 497–498. German text in *Kants Gesammelte Schriften* Vol. 9, Berlin–Leipzig 1923, 220. N. 142 at Watkins ed. p. 731 identifies Plutarch as the real one. It is perhaps odd that Kant failed to refer to Seleucus, see §9 below.

§4 This intermediate function of the winds (attested for Aristotle, see at §1) is not confirmed in the other documentation for Posidonius’ views on tides, see Kidd (1986) 523–525, (1999) 198. Theiler (1982) 204–205 prefers to accept this evidence, though he, too, points out that the doxa is quite similar to that attributed to Aristotle and Heraclides in §1. Ioannes Lydus may have Posidonius in mind when opaquely mentioning those who practise philosophy in Rome (83.3)

§9 Plutarch, cited section E(a)§9, tells us that Seleucus, like Aristarchus, ‘moved the earth’. Aristarchus’ theory that the earth revolves around the sun could be seen as blasphemous (Cleanthes at Plu. *Fac.* 923A = *SVF* 1.500; his Πρὸς Ἀρίσταρχον is on the list of his books at D.L. 7.174 = *SVF* 1.481). The less radical theory of Heraclides and Ecphantus (and Plato according to some), concerned with axial rotation, could be seen as counter-intuitive and bizarre. It is not certain that Seleucus followed Aristarchus all the way, though this is argued by Roller (2005) 114. All we need for the theory at issue in §9 is the axial rotation of the earth plus its atmosphere (see Heath 1913, 307), which in combination with the counter-influence of the moon (revolving around the earth) is sufficient to cause the movement of the tides. That Seleucus, ‘too, moved the earth’ need not mean more than that he did so in the same way as Heraclides and Ecphantus mentioned a few chapters back, i.e. ‘not from one place to another, but by revolution in the manner of a wheel upon an axle, from west to east about its own centre’ (ch. 3.13.3). Nevertheless his thesis may count as a stunning anticipation of Newton’s explanation of the tides as the combined result of the moon’s influence and the earth’s own movement.

Broggiato (2001) believes that καὶ αὐτός implies that A believes that Crates, just as Seleucus, set the earth in motion, which according to her is wrong because Crates’ universe is geocentric. So A, she adds, must have someone else in mind, e.g. Apollodorus (see above for Aristarchus). But an earth in the middle

may still move around its axis. Seleucus' rejection of Crates' explanation of the tides may involve a rejection of Crates' view of the earth's immobility, if this is what he believed.

For possible confusions in Strabo's reportage and even in Posidonius' account see Kidd (1988) 2.777–779. Russo (1995) 149 argues that it is odd that the lemma should mention the Atlantic instead of the Indian Ocean studied by 'Seleucus of Babylonia' according to Strabo and his sources (cited section E(b)§9). It is of course possible that the doxography is to be blamed: since the Atlantic is mentioned in §2 (τὴν Ἀτλαντικὴν θάλασσαν) and §6 (τὴν Ἀτλαντικὴν), τὸ Ἀτλαντικὸν πέλαγος may have supplanted an original τὴν Ἐρυθρὰν θαλάττην in §9. On the other hand the general, or astronomical, causes of the tides, valid for all Oceans, should not be confused with the particular variations responsible for local differences.

e Other Evidence

The chapters on the moon in Book 2, 2.25–31, fail to refer to the influence of the moon on the tides, our §§3–4 and §9. Chs. 2.20–24 on the sun fail to refer to the purported role of the sun, our §§1–2, and ch. 3.7 on winds fails to refer to the purported role of winds, our §1 and §5. These differences are in agreement with the Hellenistic origins of the present chapter, in which not a single Presocratic philosopher is mentioned.

The tides of the sea, not explained by Aristotle, are not discussed by Epicurus (as far as we know), and not by Lucretius either. Epicurus is a younger contemporary of Theophrastus, who as we noted does not seem to have treated the tides either. Treatment by Dicaearchus is uncertain (see ad §2, the attribution of which is hypothetical and the gist unclear). Lucretius, in his section on the sea *DRN* 6.608–639 (after his treatment of earthquakes [cf. ch. 3.15], and before that of Etna which in its turn is followed by the passage on the Nile [cf. ch. 4.1]), *inter alia* discusses the traditional issue why the mass of the sea does not grow less, while at 5.506–508 he mentions the Black Sea, 'which flows on with changeless tide, preserving ever the constant rhythm of its gliding' (tr. Bailey). So we may hypothesize that he declined to treat the subject because there was no antecedent in Epicurus. The importance of the Oceanic tides only became known through the expedition of Pytheas, whose book was not known to or at any rate not used by Aristotle, and esp. the campaigns of Alexander the Great.

E Further Related Texts

a Proximate Tradition

§1 Aristotle Heraclides: Aristotle *Mete.* 2.1 354a5–11 ρέουσα δ' ἡ θάλαττα φαίνεται κατὰ τε τὰς στενότητας, εἴ που διὰ τὴν περιέχουσιν γῆν εἰς μικρὸν ἐκ μεγάλου συνάγεται πελάγους, διὰ τὸ ταλαντεύεσθαι δεῦρο κάκεισε πολλάκις. ἥ δὲ διὰ τὴν στενότητα τῆς γῆς ὀλίγον ἐπέχει τόπον, ἀναγκαῖον τὴν ἐν τῷ πελάγει μικρὰν ταλάντωσιν ἐκεῖ φαίνεσθαι μεγάλην. *Mete.* 2.8 366a18–20 ὥστ' ἔσω γίγνεται πάλιν ἡ ῥύσις, ὥσπερ ἄμπωτις, εἰς τοῦναντίον τῆς ἔξω πλημμυρίδος. *Mete.* 2.8 367a13–17 ὅταν γὰρ ἄνεμος μέλλῃ πνευσεῖσθαι νότος, προσημαίνει πρότερον· ἡχοῦσι γὰρ οἱ τόποι ἐξ ὧν γίγνεται τὰ ἀναφυσήματα, διὰ τὸ τὴν θάλατταν μὲν προωθείσθαι ἤδη πόρρωθεν, ὑπὸ δὲ ταύτης τὸ ἐκ τῆς γῆς ἀναφυσώμενον ἀπωθεῖσθαι πάλιν εἴσω, ἥπερ ἐπέρχεται ἡ θάλαττα ταύτῃ. *GA* 2.4 738a20–22 αἱ δὲ τῶν μηνῶν σύνοδοι ψυχραὶ διὰ τὴν τῆς σελήνης ἀπόλειψιν, διόπερ καὶ χειμερίους συμβαίνει τὰς συνόδους εἶναι τῶν μηνῶν μάλλον ἢ τὰς μεσότητας. *GA* 4.10 777b17–778a2 εὐλόγως δὲ πάντων οἱ χρόνοι καὶ τῶν κήσεων καὶ γενέσεων καὶ τῶν βίων μετρεῖσθαι βούλονται κατὰ φύσιν περιόδοις. λέγω δὲ περίοδον ἡμέραν καὶ νύκτα καὶ μῆνα καὶ ἐνιαυτὸν καὶ τοὺς χρόνους τοὺς μετρούμενους τούτοις, ἔτι δὲ τὰς τῆς σελήνης περιόδους. εἰσὶ δὲ περιodoi σελήνης πανσέληνός τε καὶ φθίσις καὶ τῶν μεταξὺ χρόνων αἱ διχοτομίαι· κατὰ γὰρ ταύτας συμβάλλει πρὸς τὸν ἥλιον· ὁ γὰρ μεις κοινὴ περίοδος ἐστὶν ἀμφοτέρων. ἔστι δὲ ἡ σελήνη ἀρχὴ διὰ τὴν πρὸς τὸν ἥλιον κοινωνίαν καὶ τὴν μετάληψιν τὴν τοῦ φωτός· γίγνεται γὰρ ὥσπερ ἄλλος ἥλιος ἐλάττων· διὸ συμβάλλεται εἰς πάσας τὰς γενέσεις καὶ τελειώσεις. αἱ γὰρ θερμότητες καὶ ψύξεις μέχρι συμμετρίας τινὸς ποιοῦσι τὰς γενέσεις, μετὰ δὲ ταῦτα τὰς φθοράς· τούτων δ' ἔχουσι τὸ πέρας καὶ τῆς ἀρχῆς καὶ τῆς τελευτῆς αἱ τούτων κινήσεις τῶν ἄστρον. ὥσπερ γὰρ καὶ θάλατταν καὶ πᾶσαν ὥρῳ μὲν τὴν τῶν ὑγρῶν φύσιν ἱσταμένην καὶ μεταβάλλουσιν κατὰ τὴν τῶν πνευμάτων κίνησιν καὶ στάσιν, τὸν δ' ἀέρα καὶ τὰ πνεύματα κατὰ τὴν τοῦ ἡλίου καὶ τῆς σελήνης περίοδον, οὕτω καὶ τὰ ἐκ τούτων φυόμενα καὶ τὰ ἐν τούτοις ἀκολουθεῖν ἀναγκαῖον· κατὰ λόγον γὰρ ἀκολουθεῖν καὶ τὰς τῶν ἀκυροτέρων περιόδους ταῖς τῶν κυριωτέρων. βίος γὰρ τις καὶ πνεύματός ἐστι καὶ γενέσις καὶ φθίσις. *Mete.* 2.5 361b14–23 ὁ δ' ἥλιος καὶ παύει καὶ συνεξορμᾷ τὰ πνεύματα· ἀσθενεῖς μὲν γὰρ καὶ ὀλίγας οὐσας τὰς ἀναθυμιάσεις μαραίνει τῷ πλείονι θερμῷ τὸ ἐν τῇ ἀναθυμιάσει ἔλαττον ὄν, καὶ διακρίνει. ἔτι δὲ αὐτὴν τὴν γῆν φθάνει ξηραίνων πρὶν γενέσθαι ἔκκρισιν ἀθρόαν διὰ μὲν οὖν ταύτας τὰς αἰτίας καταπαύει τε τὰ πνεύματα καὶ ἐξ ἀρχῆς γίγνεσθαι κωλύει, τῇ μὲν μαράνσει καταπαύων, τῷ δὲ τάχει τῆς ξηρότητος γίγνεσθαι κωλύων. **John Philoponus in GA** 210.7–16 ad loc. ἐν δὲ τῇ λέξει τῇ 'τούτων δ' ἔχουσι τὸ πέρας καὶ τῆς ἀρχῆς καὶ τῆς τελευτῆς' τὸ 'τούτων' περὶ τῆς θερμότητος καὶ ψυχρότητος εἴρηται. ἀρχὴ μὲν γὰρ καὶ γενέσις ἐστὶ θερμότητος ἢ τε τῆς σελήνης αὐξήσις καὶ ἡ τοῦ ἡλίου πρὸς τὰ βόρεια ζῶδια προσέλευσις, ψύξεως δ' ἐκείνης μὲν ἡ μείωσις, τοῦ δὲ

ἡλίου ἢ πρὸς τὰ νότια ἀναχώρησις. καὶ ὥσπερ ἡ θάλασσα μεταβάλλει κατὰ τὴν τῶν πνευμάτων κίνησιν, τὰ δὲ πνεύματα γίνεται, ὡς ἐν τοῖς Μετεώροις (2.4 361a22–b1) εἴρηται, κατὰ τὴν τοῦ ἡλίου καὶ τῆς σελήνης περίοδον, οὕτως καὶ τὰ ἐκ τῶν ὑγρῶν καὶ τῶν ἄλλων γινόμενα καὶ ἐν αὐτοῖς ὄντα ἀκολουθεῖν ἀναγκαῖον τῇ τῶν ἀστέρων τοῦτων κινήσει. **Theophrastus Vent.** 17 ποιεῖ δὲ καὶ ἡ σελήνη ταῦτά (sc. as the sun) πλὴν οὐχ ὁμοίως· οἷον γὰρ ἀσθενὴς ἡλιός ἐστι. διὸ καὶ νύκτωρ δεινότεραι (αἱ πνοαὶ) καὶ αἱ σύνοδοι τῶν μηνῶν χειμερινώτεραι. συμβαίνει δ' οὖν ὅτε μὲν ἀνατέλλοντος τοῦ ἡλίου τὰ πνεύματα ἐπαίρεσθαι ὅτε δὲ λήγειν· καὶ ἐπὶ τῆς δύσεως ὁμοίως· ὅτε μὲν γὰρ κατέπαυσεν ὅτε δὲ ὥσπερ ἀφήκεν. εἰ δέ ποτε καὶ κατὰ σύμπτωμα γίνωτο ταῦτα, καθάπερ καὶ τὰ ἐπὶ τῶν ἄστρων ἀνατολαῖς καὶ δύσεσιν, ἐπισκεπτέον. **CP** 2.19.4–5 τὰ δὲ πλέον καταδυόμενα καὶ ὑπερίσχοντα δῆλον ὅτι ψυχρότερα καὶ ἀσθενέστερα, δι' ὃ μᾶλλον συμπάσχει ταῖς μεταβολαῖς. ἡ δὲ αἴσθησις οὕτως ὀξεῖα γινομένη τοῖς καθ' ὕδατος οὐκ ἄλογος, ἄλλως τε καὶ ἐν τόποις θερμοῖς καὶ ἐμπύροις. ἐπεὶ καὶ ἐν τοῖς μὴ τοιούτοις αἱ διαδόσεις ταχεῖαι πάντων ἀπὸ τοῦ ἡλίου καὶ τῶν ἄστρων. φαίνεται γοῦν συμπάσχειν οὐ μόνον τὰ ἐπὶ γῆς ἀλλὰ καὶ τὰ ὑπὸ γῆς ὕδατα τροπαῖς τε καὶ ἐπιτολαῖς· ἐπ' ἐνίων δὲ ἄστρων καὶ αὐτὴ ἡ γῆ καὶ ἡ θάλαττα μεταβάλλει. πάσχει δέ τι παραπλήσιον τούτῳ καὶ τῶν ἀνθρώπων πολλὰ καθ' ἡμέραν· αἱ γὰρ συμπεριφέρεται τῷ ἡλίῳ νεύοντα καὶ ἐγκλίνοντα πρὸς αὐτόν. **Lucan Phars.** 1.409–419 *quaque iacet litus dubium quod terra fretumque / vindicat alternis vicibus, cum funditur ingens / Oceanus uel cum refugis se fluctibus aufert. / ventus ab extremo pelagus sic axe volutet / destituatque ferens, an sidere mota secundo / Tethyos unda vagae lunaribus aestuet horis, / flammiger an Titan, ut alentes hauriat undas, / erigat Oceanum fluctusque ad sidera ducat, / quaerite, quos agitat mundi labor; at mihi semper / tu, quaecumque moves tam crebros causa meatus, / ut superi voluere, late.* **ps.Aristotle Mirab.** 55 834b3–4 ὁ πορθμὸς ὁ μεταξὺ Σικελίας καὶ Ἰταλίας αὔξεται καὶ φθίνει ἅμα τῷ σεληνίῳ. **Aulus Gellius NA** 14.1.3–4 (quoting Favorinus on the Chaldaean) *atque eos, quoniam viderent terrena quaedam inter homines sita caelestium rerum sensu atque ductu moveri, quale est, quod Oceanus quasi lunae comes cum ea simul senescit adolescitque, hinc videlicet sibi argumentum ad persuadendum paravisse, ut crederemus omnia rerum humanarum et parva et maxima tamquam stellis atque sideribus evincta duci et regi. esse autem nimis quam ineptum absurdumque, ut, quoniam aestus Oceani cum lunae curriculo congruit, negotium quoque alicuius, quod ei forte de aquae ductu cum rivalibus aut de communi pariete cum vicino apud iudicem est, ut existimemus id negotium quasi habena quadam de caelo vinctum gubernari.* **Ptolemy Tetr.** 1.2.3–4 ἡ τε σελήνη πλείστην ὡς περιγειοτάτῃ διαδίδωσιν ἡμῖν ἐπὶ τὴν γῆν τὴν ἀπόρροϊαν, συμπαθούτων αὐτῇ καὶ συντρεπομένων τῶν πλείστων καὶ ἀψύχων καὶ ἐμψύχων καὶ ποταμῶν μὲν συναυξόντων καὶ συμμειούντων τοῖς φωσὶν αὐτῆς τὰ ρεύματα, θαλασσῶν δὲ συντρεπουσῶν ταῖς ἀνατολαῖς καὶ ταῖς δύσεσι τὰς ἰδίας ὁρμάς, φυτῶν δὲ καὶ ζώων ἢ ὅλων ἢ κατὰ τινα μέρη (4) συμπληρουμένων τε αὐτῇ καὶ συμμειουσμένων. **Tetr.** 2.9.7 περὶ δὲ ποταμοὺς ἢ καὶ θαλάσσας κοινῶς μὲν χειμῶνας καὶ στόλων ναυάγια καὶ δυσπλοίας καὶ τῶν ἰχθύων ἔνδειαν καὶ φθοράν (sc. ὁ τοῦ Κρόνου ἀστήρ ἐμποιεῖ), ἰδίως δὲ ἐν μὲν θαλάσσαις ἀμπώτεις καὶ παλιρροίας, ἐπὶ δὲ ποταμῶν ὑπερμετρίαν καὶ κάκωσιν τῶν ποταμίων ὕδατων. **Tetr.** 2.13.7–8

αὐτῶν δὲ τούτων τῶν κατὰ μέρος ποιότητων αἱ καθ' ἡμέραν ἐπιτάσεις ἀποτελοῦνται μάλιστα μὲν ὅταν τῶν ἀπλανῶν οἱ λαμπρότεροι καὶ δραστικώτεροι φάσεις ἐφάσῃ ἢ ἐσπερίας ἀνατολικὰς ἢ δυτικὰς ποιῶνται πρὸς τὸν ἥλιον, τρέπουσι γὰρ ὡς ἐπὶ τὸ πολὺ τὰς κατὰ μέρος καταστάσεις πρὸς τὰς ἑαυτῶν φύσεις, οὐδὲν δὲ ἔλαττον (8) καὶ ὅταν τινὶ τῶν κέντρων τὰ φῶτα ἐπιπορεύηται. πρὸς γὰρ τὰς τοιαύτας αὐτῶν σχέσεις αἱ καθ' ὥραν ἀνέσεις καὶ ἐπιτάσεις τῶν καταστημάτων μεταβάλλουσι, καθάπερ πρὸς τὰς τῆς σελήνης αἱ τε ἀμπώτεις καὶ αἱ παλίρροιαι. **Sextus Empiricus M.** 9.79 (SVF 2.1013) ἐπεὶ οὖν καὶ ὁ κόσμος σῶμά ἐστιν, ἦτοι ἠνωμένον ἐστὶ σῶμα ἢ ἐκ συναπτομένων ἢ ἐκ διεστώτων. οὐτε δὲ ἐκ συναπτομένων οὔτε ἐκ διεστώτων, ὡς δεῖ κνυμεν ἐκ τῶν περὶ αὐτὸν συμπαθειῶν. κατὰ γὰρ τὰς τῆς σελήνης αὐξήσεις καὶ φθίσεις πολλὰ τῶν τε ἐπιγείων ζῶων καὶ θαλασσίων φθίνει τε καὶ αὖξεται, ἀμπώτεις τε καὶ πλημμυρίδες περὶ τινὰ μέρη τῆς θαλάσσης γίνονται. **Commenta Bernensia in Lucanum** p. 30.28–29 Usener (ad Phars. 1.413) *quia hic dicit crescere et decrescere mare ad imitationem lunae*.

§4 Posidonius: Cleomedes Cael. 2.1.386–392 Todd τοσαύτη δὲ πρὸς τοῖς εἰρημένοις κέχρηται περιουσίᾳ δυνάμεως (sc. ὁ ἥλιος), ὥστε καὶ ἡ σελήνη ἀπ' αὐτοῦ δεχομένη τὸ φῶς αὐτὸ τοῦτο πάσης τῆς περὶ αὐτὴν δυνάμεως αἴτιον ἔχει κατὰ τὰς τῶν σχημάτων διαφοράς, οὐ μόνον ἐν τῷ ἀέρι μεγάλας ἐργαζομένη τροπὰς καὶ κατακρατοῦσα αὐτοῦ καὶ μυρία ἐπιτήδεια ἐργαζομένη, ἀλλὰ καὶ τῶν περὶ τὸν Ὠκεανὸν πλημμυρίδων καὶ ἀμπώτεων αὕτη ἐστὶν αἰτία. **Cael.** 2.3.64–65 Todd καὶ τῶν περὶ τὸν Ὠκεανὸν ἀμπώτεων καὶ πλημμυρίδων αὐτῆς (sc. τῆς σελήνης) αἰτίας γινομένης.

§5 Plato: Plato Phd. 111e–112a ταῦτα δὲ πάντα κινεῖν ἄνω καὶ κάτω ὥσπερ αἰώραν τινὰ ἐνοῦσαν ἐν τῇ γῇ· ἐστὶ δὲ ἄρα αὕτη ἡ αἰώρα διὰ φύσιν τοιάνδε τινά. ἐν τι τῶν χασμάτων τῆς γῆς ἄλλως τε μέγιστον τυγχάνει ὃν καὶ (112a) διαμπερές τετρημένον δι' ὅλης τῆς γῆς, τοῦτο ὅπερ Ὅμηρος εἶπε, λέγων αὐτό (*Il.* Θ 14) 'τῆλε μάλ', ἦχι βάθιστον ὑπὸ χθονός ἐστι βέρεθρον·' ὃ καὶ ἄλλοθι καὶ ἐκεῖνος καὶ ἄλλοι πολλοὶ τῶν ποιητῶν Τάρταρον κεκλήκασιν. εἰς γὰρ τοῦτο τὸ χάσμα συρρέουσι τε πάντες οἱ ποταμοὶ καὶ ἐκ τούτου πάλιν ἐκρέουσιν· γίγνονται δὲ ἕκαστοι τοιοῦτοι δι' οἷας ἂν καὶ τῆς γῆς ῥέωσιν. (cf. **Athenodorus Calvus** at **Strab.** 3.5.7, 173C.10–12 εἰ δ', ὥσπερ Ἀθηνόδωρος (*FGrH* 746F5c) φησιν, εἰσπνοῇ τε καὶ ἐκπνοῇ τὸ συμβαίνειν περὶ τὰς πλημμυρίδας καὶ περὶ τὰς ἀμπώτεις ἔοικεν.) **Aristotle Mete.** 2.2 355b32–356a11 τὸ δ' ἐν τῷ Φαίδωνι γεγραμμένον περὶ τε τῶν ποταμῶν καὶ τῆς θαλάττης ἀδύνατόν ἐστιν. λέγεται γὰρ ὡς ἅπαντα μὲν εἰς ἄλληλα συντέτρηται ὑπὸ γῆν, ἀρχὴ δὲ πάντων εἷη καὶ πηγὴ τῶν ὑδάτων ὁ καλούμενος Τάρταρος, περὶ τὸ μέσον ὑδατός τι πλῆθος, ἐξ οὗ καὶ τὰ ῥέοντα καὶ τὰ μὴ ῥέοντα ἀναδίδωσιν πάντα· τὴν δ' ἐπίρρυσιν ποιεῖν ἐφ' ἕκαστα τῶν ῥευμάτων διὰ τὸ σαλεύειν αἰεὶ τὸ πρῶτον καὶ τὴν ἀρχὴν οὐκ ἔχειν γὰρ ἔδραν, ἀλλ' αἰεὶ περὶ τὸ μέσον εἰλεῖσθαι· κινούμενον δ' ἄνω καὶ κάτω ποιεῖν τὴν ἐπίρυσιν τοῖς ῥεύμασιν. τὰ δὲ πολλαχού μὲν λιμνάζειν, οἷον καὶ τὴν παρ' ἡμῖν εἶναι θάλατταν, πάντα δὲ πάλιν κύκλῳ περιάγειν εἰς τὴν ἀρχήν, ὅθεν ἡρξαντο ῥεῖν, πολλὰ μὲν κατὰ τὸν αὐτὸν τόπον, τὰ δὲ καὶ καταντικρὺ τῇ θέσει τῆς ἐκροῆς, οἷον εἰ ῥεῖν ἡρξαντο κάτωθεν, ἄνωθεν εἰσβάλλειν. **Plutarch Fac.Lun.** 924B–C οὐ ῥεύμα λάβρον ὑδατος κάτω φερόμενον, εἰ πρὸς τὸ μέσον ἔλθοι σημεῖον ὅπερ αὐτοὶ λέγουσιν ἀσώματον, ἴστασθαι περικουρυσσόμενον (ἢ) κύκλῳ περιπολεῖν, ἄπαυστον αἰώραν καὶ ἀκατάπαυστον αἰωρούμενον;

§7 Crates: Strabo 1.1.7, 4C.21–35 ἔχεται δὲ τῆς αὐτῆς φιλοπραγμοσύνης καὶ τὸ μὴ ἄγνοεῖν τὰ περὶ τὰς πλημμυρίδας τοῦ ὠκεανοῦ καὶ τὰς ἀμπώτεϊς ἀψορρόου ὠκεανοῖο, λέγοντα καὶ (*Od.* 12.105) ‘τρίς μὲν γάρ τ’ ἀνίησιν ἐπ’ ἤματι, τρίς δ’ ἀναροιβδεῖ’ (but Charybdis is meant, not the Ocean). καὶ γὰρ εἰ μὴ τρίς ἀλλὰ δις, τάχα τῆς ἱστορίας παραπεσόντος ἢ τῆς γραφῆς διημαρτημένης, ἀλλ’ ἢ γε προαίρεσις τοιαύτη. καὶ τὸ ‘ἐξ ἀκαλαρρείταο’ (*Il.* 7.422) δὲ ἔχει τινὰ ἔμφασιν τῆς πλημμυρίδος, ἐχούσης τὴν ἐπίβασιν πραεῖαν καὶ οὐ τελέως ῥοώδη. Ποσειδώνιος (F 216 E.-K., 1 Theiler) δὲ καὶ ἐκ τοῦ σκοπέλους λέγειν τοτὲ μὲν καλυπτομένους τοτὲ δὲ γυμνουμένους καὶ ἐκ τοῦ ποταμὸν φάναι τὸν ὠκεανὸν εἰκάζει τὸ ῥοώδες αὐτοῦ τὸ περὶ τὰς πλημμυρίδας ἐμφανίζεσθαι. τὸ μὲν οὖν πρῶτον εὖ, τὸ δὲ δεύτερον οὐκ ἔχει λόγον· οὔτε γὰρ ποταμῷ ῥέυματι ἔοικεν ἢ τῆς πλημμυρίδος ἐπίβασις, πολὺ δὲ μάλλον ἢ ἀναχώρησις οὐ τοιαύτη, ὅτε τοῦ Κράτητος (cf. ad. fr. 61 Broggiato) λόγος διδάσκει τι πιθανώτερον. 1.2.36, 43C.21–29 περὶ δὲ τῶν τοῦ Ὀκεανοῦ παθῶν εἴρηται μὲν ἐν μύθου σχήματι· καὶ γὰρ τούτου στοχάζεσθαι δεῖ τὸν ποιητὴν. ἀπὸ γὰρ τῶν ἀμπώτεων καὶ τῶν πλημμυρίδων ἢ Χάρυβδις αὐτῷ μεμύθευται, οὐδ’ αὐτὴ παντάπασιν Ὀμήρου πλάσμα οὔσα, ἀλλ’ ἀπὸ τῶν ἱστορουμένων περὶ τὸν Σικελικὸν πορθμὸν διεσκευασμένη. εἰ δὲ δις τῆς παλιρροίας γινομένης καθ’ ἑκάστην ἡμέραν καὶ νύκτα ἐκείνος τρίς εἶρηκε (*Od.* 12.105) ‘τρίς μὲν γάρ τ’ ἀνίησιν ἐπ’ ἤματι, τρίς δ’ ἀναροιβδεῖ,’ λέγοιτ’ ἂν καὶ οὕτως· οὐ γὰρ κατ’ ἄγνοιαν τῆς ἱστορίας ὑποληπτέον λέγεσθαι τοῦτο, ἀλλὰ τραγωδίας χάριν καὶ φόβου.

Preface IX

Sigla and Abbreviations XII

General Introduction 1

BOOK 1 The Principles of Nature: Text and Commentary 101

PART 2

Sigla and Abbreviations IX

User's Guide to the Edition and Commentary 719

BOOK 2 Cosmology: Text and Commentary 727

BOOK 3 Meteorology and the Earth: Text and Commentary 1129

PART 3

Sigla and Abbreviations IX

User's Guide to the Edition and Commentary 1347

BOOK 4 Psychology: Text and Commentary 1355

Introduction to Book 4 1357

Title and Index 1366

Procemium 1372

1 On the Rising of the Nile 1374

2 On the Soul 1393

3 Whether the Soul Is a Body and What Its Substance Is 1421

4 On the Parts of Soul 1449

5 On the Regent Part and in Which Part of the Body It Is Found 1473

6 On the Motion of Soul 1495

- 7 On the Indestructibility of Soul 1503
- 7a On Intellect 1526
- 8 On Sensation and Sense-Objects 1537
- 9 Whether Sensations and Impressions Are True 1560
- 10 How Many Senses There Are 1583
- 11 How the Sensation and the Conception and the Reason That Is Internally Placed Occur 1591
- 12 In What Respect Impression, Impressor, Imagination, Figment Are Different 1610
- 13 On Sight, How We See 1621
- 14 On Reflections in Mirrors 1652
- 15 Whether Darkness Is Visible 1663
- 16 On Hearing 1673
- 17 On Smelling 1679
- 18 On Tasting 1683
- 19 On Voice 1688
- 20 Whether Voice Is Incorporeal and How Echo Occurs 1703
- 21 How the Soul Comes To Be Sentient and What Its Regent Part Is 1711
- 22 On Respiration 1720
- 23 On Bodily Affections and Whether the Soul Experiences Pain along with These 1731

BOOK 5 Physiology: Text and Commentary 1739

- Introduction to Book 5 1741
 - Title and Index 1754
- 1 On Divination 1759
- 2 How Dreams Occur 1772
- 3 What the Substance of the Semen Is 1784
- 4 Whether the Semen Is a Body 1796
- 5 Whether Females Too Release Semen 1803
- 6 How the Conceptions Occur 1812
- 7 How Males and Females Are Engendered 1817
- 8 How Monstrosities Occur 1830
- 9 Why a Woman, Although Frequently Having Intercourse, Does Not Conceive 1837
- 10 How Twins and Triplets Occur 1844
- 11 Where Resemblances to Parents or Ancestors Come From 1851
- 12 How It Occurs That Those Who Are Born Resemble Others and Not Their Parents 1861
- 13 How It Happens That Women Are Infertile and Men Without Offspring 1868

- 14 Why Female Mules Are Infertile 1876
- 15 Whether the Embryo Is a Living Being 1883
- 16 How Embryos Are Nourished 1897
- 17 What Is Fully Formed First in the Womb 1904
- 18 Why Seven-Month Babies Are Viable 1914
- 19 On the Birth of Living Beings, How They Were Born as Living Beings and Whether They Are Perishable 1934
- 20 How Many Kinds of Living Beings There Are and Whether They All Possess Sense-Perception and Reason 1948
- 21 In What Length of Time Living Beings Are Formed When They Are in the Womb 1958
- 22 Out of What Elements Each of the Generic Parts in Us Consists 1968
- 23 When and How a Human Being Commences Maturity 1978
- 24 How Sleep and Death Occur 1989
- 25 Whether Sleep and Death Pertain to the Soul or the Body 1998
- 26 How Plants Grew and Whether They Are Living Beings 2008
- 27 On Nourishment and Growth 2022
- 28 From Where the Appetites Arise in Living Beings, and Also Pleasures 2029
- 29 How Fever Occurs and Whether It Is an After-Symptom 2035
- 30 On Health and Disease and Old Age 2043

PART 4

- English Translation of the *Placita* 2059**
- User's Guide to the English Translation 2061
- BOOK 1 The Principles of Nature 2063
- BOOK 2 Cosmology 2089
- BOOK 3 Meteorology and the Earth 2108
- BOOK 4 Psychology 2120
- BOOK 5 Physiology 2137

User's Guide to the Edition and Commentary

1 Introduction

The aim of this user's guide is to assist the reader in making use of the present Edition and Commentary on the *Placita*. It is a pared down version of section 6 of the General Introduction. For references to further discussion of details see the notes to the General Introduction in Volume One.

2 The Division into Four Parts

The sequence of the Edition and Commentary is based on the insight that ps.Plutarch's *Epitome* of the original no longer extant work by and large preserves the structure of Aëtius' compendium. Part One contains the necessary preliminaries, including the General Introduction, followed by the Edition and Commentary on Book 1 on the principles of nature. Part Two comprises Book 2 on cosmology and the heavens and Book 3 on meteorology and the earth. Part Three treats Book 4 on the psychology of the human being and Book 5 on the physiology of the human being and other animals. For each of the five books, the edition of its chapters is preceded by a compact introduction giving an overview of its transmission, subject-matter, name-labels of philosophers and schools, method and sources. Part Four presents an English translation of the edited text of all five books, together with the bibliography and the indices.

For all the 135 chapters of the entire work, the Edition and Commentary use an identical method and layout. Only the chapters on the pinakes and the four procœmia to Books 1–4 differ in a few respects. The essential features of this method and layout will now be explained in detail, commencing with the edition.

3 The Edition

Following the conventions of classical scholarship, the edition of the Greek text and all its accompanying apparatus are formulated in Latin. The many abbreviations and sigla that we use are set out at the beginning of Parts One to Three.

For each chapter we begin with a list of the relevant *testes* (witnesses). First in this list are the passages from the *testes primi* (primary witnesses) and the name of the editor of the text edition used. These witnesses are: ps.Plutarch

(abbreviated P) and his tradition, Stobaeus (S) and Theodoret (T). Below them on the next line, passages from the *testes secundi* (secondary witnesses) are listed when available, again including their abbreviation and the name of the editor used. They are always introduced with the capitalised Latin abbreviation Cf. (abbreviation of *confer*, i.e. 'compare' or 'see also').

The text of the chapter then follows. It begins with the *titulus* (chapter heading), followed by the numbered lemmata, each consisting of one or more name-labels (sometimes unspecified) plus a doxa. The lines of the text are continuously numbered, as indicated in the margin, beginning with the chapter heading. Following the heading and each lemma of the chapter the primary sources for its text are indicated by the sigla (P,S,T), or (P,S) when T is lacking, or (S,T) when P is lacking, or (P,T) when S is lacking, or only one of these when only one primary source is available. The numbers after the siglum in each case indicate the number of the doxa in the sequence of the text of the primary witness as indicated in the text used.¹ This system gives the crucial information on the attestation of the lemmata at a single glance.

Beneath the text we first list the references to the collections of fragments of Presocratics, Academics, Peripatetics, Stoics and others where individual lemmata can be located. In the case of the Presocratics we refer only to the sixth edition of Diels-Kranz (abbreviated DK), not to collections of individual authors. Similarly for the Stoics we use where possible Von Arnim's collection (*SVF*). For other authors we use the most recent collections.² In the case of authors whose original writings survive, we refer to passages from which the doxa is derived, whether directly or indirectly.

Next we present the apparatus criticus to the text. Its aim is to give full and detailed insight into all the relevant variants of the primary and secondary witnesses. It is therefore not a *negative* but a *positive* apparatus.³ This is necessary because we are not editing a single text from manuscripts and indirect quotations, but rather are *reconstructing* our text from a multiplicity of witnesses both direct (*primi*) and indirect (*secundi*), each of which has its own relation to the lost original *Placita* as collected by Aëtius.⁴ Some of these, such as the frag-

1 These numbers are not found in the texts of Mau, Wachsmuth and Raeder. They have been supplied by us.

2 Rarely we list two collections when they are both current or complementary, e.g. for Strato (Wehrli, Sharples) and Posidonius (Edelstein-Kidd, Theiler).

3 Contrary to our previous practice in the *specimen reconstructionis* of Book 2 in M–R vol. 2.2; see General Introduction, section 2.8.

4 For detailed accounts of these witnesses and the editions used see General Introduction, section 4.2–4.

ments of ps.Plutarch in the Antinoopolis papyrus, the Arabic version of ps.Plutarch by Qusṭā ibn Lūqā translated into German by Hans Daiber, and the new critical edition of a large part of ps.Galen by Mareike Jas, have become available only quite recently. In addition we pay due attention to a variety of earlier editions and also note significant readings, conjectures and emendations when the texts of individual doxai are included in collections of fragments. In general, it is only in the case of the primary witnesses ps.Plutarch and Stobaeus (but not Theodoret) that we give the variants of the main manuscripts. For other texts we give the preferred reading of the relevant critical edition, only mentioning manuscript variants on rare occasions. The Arabic translation of Qusta is cited in Daiber's German version. Based on these principles, the apparatus criticus not only strives to shed light on our choices, but also to inform the user about the peculiarities of the widespread tradition. Because this apparatus is necessarily often rather extensive, it proved impossible to allocate room for the translation next to the Greek text in a synoptic format without chopping up text, translation, and apparatus and creating a succession of blank spaces. For this reason the translations of the Greek text of all 135 chapters, forming a continuous English version of the treatise as a whole, have been printed in the final part, *Aëtiana* 5.4.

Three more sections of the edition remain. First we print the texts of the *testes primi* (primary witnesses) for the reconstruction. In first place is always Theodoret when he has cited this text, followed—with its own sub-heading—by the *traditio ps.Plutarchi*, i.e. the bevy of representatives of the tradition of the *Epitome* available for the relevant chapter. First when available is the Antinoopolis papyrus. This is followed by the text of ps.Galen, the most important of the witnesses to this tradition. We also include texts from ps.Justin, Cyril, Lydus, Psellus, Symeon Seth and others, all of whom excerpted ps.Plutarch. For reasons of space the texts of ps.Plutarch and Stobaeus themselves (and also Eusebius' verbatim excerpts) are not quoted separately. They can be readily found elsewhere. But it is important to note that our debts to and differences from Diels' *DG* edition of Aëtius and to other editions of the primary witnesses are fully accounted for in the apparatus criticus to the Greek text, and often also further discussed in the Commentary.

Next is a section setting out the *testes secundi* (secondary witnesses) who can also offer some assistance for the reconstruction and analysis of the text.⁵ They represent the doxographical traditions closest to Aëtius. Some of these, namely

5 For detailed accounts of these witnesses and the editions used see above, General Introduction, 4.5.

Athenagoras, Achilles, and Nemesius were included by Diels in his apparatus among the *aliorum ex Aetio excerpta*. Because, unlike in the case of Theodoret, it is not certain that these authors actually did excerpt Aëtius, we have preferred to group them together with other passages in the *Aratea*, Hermias, and Scholia to various authors, regarding them as a collection of writings that are closest to the Aëtian tradition without being part of it. They are closer than the texts that we have placed in the proximate tradition.⁶ It should be noted that the distinction is somewhat fuzzy. Texts very close to Aëtius such as in Varro, Philodemus, Cicero and Philo of Alexandria could have been included. The difference is that these texts antedate Aëtius, whereas the *testes secundi* are all later than he is and so could have used his work, whereas this was impossible for the writers just mentioned.

The final sub-section of the edition is a collection of parallel passages quoted from the reconstructed text of other chapters of Aëtius, which we have given the title *Loci Aetiani*. These passages contain various kinds of similarities: to name-label(s) plus doxa, or to parts of doxai, or to particular formulations of doxai or name-labels. They thus provide detailed information about such uniformities as are present in the *Placita* as a whole. Parallels in chapter headings or in the quaestiones (questions or topics) being treated, are generally placed first, followed by those relating to particular lemmata.

4 The Commentary

The second main section of each chapter contains the Commentary. It too follows a fixed and identical schema of treatment, as indicated by alphabetically numbered sections, some of which are further divided into sub-sections and sometimes even further sub-divided. By consistently using this system of divisions, we aim to organise the mass of material involved with a maximum of clarity. Each of these sections and sub-sections will now be explained in turn.

A: Witnesses. In this section we present the evidence as preserved in the primary and secondary witnesses and discuss issues that it might raise. We generally commence with (1) ps.Plutarch and his tradition, since the *Epitome* mostly preserves the general structure of the work and its lemmata best. Sad to say, in the case of Book 5 this tradition is virtually all that we still have. Thereafter follows an analysis of the evidence as presented in (2) Stobaeus and (3)

⁶ See the explanation of the distinction in the General Introduction, sections 4.1 and 5.1.

Theodoret. In this section we often engage in a first sifting of the evidence for the reconstruction of the chapter, followed by further details in section D(b) below.

B: Proximate tradition and sources. This section gives an overview of the texts that can shed light on the subject and contents of the chapter. The first sub-section (1) discusses the proximate texts, i.e. the doxographical tradition which resembles the *Placita* in its focus on questions of the φυσικὸς λόγος, on philosophers and the answers they gave to those questions. These texts can be earlier than Aëtius and represent the anterior tradition from which he drew his material (though the evidence for the early period is rather thin). They can be contemporaneous with him or much later, even as late as Isidore of Seville and (rarely) authors writing in Arabic. The passages discussed may relate to the chapter as a whole or to individual lemmata within it.

The second sub-section (2) turns the attention to the ultimate sources of the subject-matter of the chapter. For the doxai of some philosophers it is sometimes possible to pin down the exact texts on which the doxai are based, e.g. in the extant works of Plato, Aristotle and Epicurus. More often other comparative material will need to be brought to bear, again from Plato and Aristotle, but also from Hellenistic, early Imperial and late ancient texts. Here too, passages discussed may relate to the chapter as a whole or to individual lemmata within it.

For both sub-sections it is the case that many or even most of the texts discussed will be printed in the third main section Further related texts below, to which we frequently cross-refer. Given the large quantity of texts involved, it is not possible to discuss all this material in great detail, but rather we will draw attention to the salient points to which it gives rise.

C: Chapter heading. In this section we give detailed discussions of the type and significance of the chapter heading, including how it relates to the standard question-types that were developed on the basis of the Aristotelian example and were used throughout antiquity. We note, where applicable, the variant readings for the heading in the witnesses and motivate our choice for the chosen formulation. We also give an overview of parallel headings that are embedded in texts or book titles elsewhere. These too are cited below in the section Further related texts.

D: Analysis. This section, which contains our interpretation of the contents of the chapter, consists of five sub-sections (though not all of these are always required for every chapter).

D(a) context. Here we briefly discuss the place of the particular chapter within the group of chapters of which it is a member and the position of this

group in the context of the Book as a whole. We also note possible analogies with the way other books of the *Placita* are structured and point out particular links that a chapter might have with chapters elsewhere and sometimes also with ancient traditions such as the Peripatos and the Stoa.

D(b) *number–order of lemmata*. In this sub-section we return to the witnesses for the contents of the chapter and determine where possible the number of doxai originally present and the order in which they were listed. For this we depend largely on the evidence of the witnesses themselves, as informed by the understanding that we have gained of their methods, but are sometimes assisted by the secondary witnesses and indeed also by texts in the proximate tradition and beyond. For determining the sequence of the doxai it is also important to understand the argumentative structure of the chapter, often revealed in its diaereses or diaphoniae (see also the following sub-section D(c)). Here we also note how our sequence compares with that established by Diels. Often the result is the same, but there are also many cases where we reach a substantially different result, which of course is fully explained and justified.

D(c) *rationale–structure of chapter*. This sub-section contains the nucleus of our interpretation of a chapter. It is a distinctive feature of the *Placita* that its chapters have an argumentative structure which is determined by the contents and position of the individual lemmata but at the same time (at least to some extent) determines their selection. The task of this section is to elucidate that structure. It may involve a listing of doxai in order of decreasing or increasing similarity according to the method of diaeresis, or it may involve a contrasting of doxai or groups of doxai in order to emphasize the conflict between them. There is much variety among the 135 chapters. It should be emphasized that the examples used above will not apply at all to monolemmatic chapters and not necessarily to other chapters with a plurality of doxai.

D(d) *further comments*. This sub-section is divided into General points, pertaining to the chapter as a whole (if pertinent), and individual points pertaining to individual lemmata. These latter, presented in order of the place of the doxa/doxai in the chapter, may relate to the constitution of the text, and/or may enter into detailed discussions of the interpretation of the philosophical or scientific view portrayed by the contents of the lemma concerned. It will be understood that, in the light of the astonishing breadth of topics and thinkers broached in the *Placita*, we have had to be necessarily selective in making such comments. References are frequently made to the secondary literature, but here too we have needed to be selective.

D(e) *other evidence*. This final sub-section of the Commentary follows on from section B above. It embarks on more substantial discussions of evidence in the wider doxographical or anterior philosophical and scientific traditions,

including some of the secondary witnesses (especially Achilles). These can be either of a textual or of a content-related nature, depending on what is relevant for the interpretation of the chapter and/or some of its individual lemmata.

5 Further Related Texts

Our presentation of each chapter ends with a third and final section entitled E: *Further Related Texts*. It too is further sub-divided into two parts.

E(a) *Proximate tradition*. Here, as the name indicates, we present an extensive collection of texts drawn from the proximate doxographical tradition, as outlined in the General Introduction, section 5.1. We print the texts in the original Greek and Latin (with occasionally some texts translated into German or English, for we have no Arabic). These texts link up with the discussion in the earlier section B(1) of the Commentary. The selection begins with General texts dealing with the subject in question and/or covering the views of a plurality of thinkers. The next section lists, where available, the texts that contain or illustrate the chapter headings or sometimes the quaestio posed by that heading. Thereafter texts are listed under the individual lemmata of the chapter. In order to facilitate the reader's orientation, the name-labels of the relevant lemma are printed in bold italics. For all three listings the texts are most often printed in full and are presented in approximate chronological order.

E(b) *Sources and other parallel texts*. In this sub-section we link up with the discussion in the earlier section B(2) of the Commentary and print a collection of texts relating to the wider tradition of ancient philosophical and scientific tradition, including those texts that shed light on the sources that the doxographers may have used to formulate the doxai collected in the *Placita*. These follow the same basic method as in the previous sub-section. They are usually printed in full in the original Latin and Greek, are divided into the same three groups in an approximately chronological sequence, and are highlighted in the same way. In the case of some texts, either very well-known or somewhat tangential to the matter at hand, we give references only.

For further discussion of the texts collected in section E of the Commentary, including a justification of their extent and the method of citing them in the ancient languages only, see the General Introduction, section 6.5.

Aetius Placita
Book 4 Psychology:
Text and Commentary

Introduction to Book 4

1 Transmission

In terms of its 24 chapters (plus proem) and 146 doxai, Book 4 of A's compendium as transmitted down to us is on the short side. But because it contains a considerable number of long lemmata, it is in fact the second longest of the Books (4038 words; only Book 1 is longer). It is relatively well attested. P^B and P^Q are available for all of its chapters. (Note that to Diels' 23 chapters we have added a ch. 4.7a consisting of the two lemmata which Diels dubiously included at the end of ch. 4.5.) The excerpts from A in T cease at 4.8, but are quite helpful as far as they go. In his excerpts from chs. 4.2–7 (the material parallel to ch. 4.6 was passed over) T usefully and significantly provides a number of parallels for lemmata in S not paralleled in P, and is the only source for three lemmata in ch. 4.4 and for one lemma in ch. 4.5—proof again of his crucial role as a source for A, for which see further above, General Introduction section 2.5. S, who of course was under no obligation to excerpt the whole work, seems to have lacked a chapter with contents corresponding to P 4.1 *On the Nile*, as there is not even a reference to the heading in Photius' index. Other chapters of S have been lost because they were edited out by the Byzantine redactors, namely those corresponding to P 4.4 (for the most part), 4.5, 4.10 (where no corresponding heading in S either), 4.12, 4.14, 4.18, and the whole block of 4.20–23. At the end of Book 4 the transmission of S is unfortunately as defective as it is for the whole of Book 5, though for 4.7a he is our sole witness.

For the tradition of P 4.2–7 we are only able to use E for chs. 4.4–5, since he did not excerpt the others. G declines to epitomize chs. 4.2–7, doubtless because of his alternative, namely c. 24 'On the soul', which belongs with a different strand of the tradition but contains much material that is parallel. This chapter has been inserted early on, preceding all but a handful of his excerpts from P Book 1. Though he omits P 4.10, he epitomizes all of P 4.1, 4.9 and 4.11–23 in successive chapters at c. 89–104, thus preserving 16 out of 24 chapters, and so complements P^B and P^Q for large sections of the Book. Yet he retains only 46 doxai, or about 30%, which is lowest for all five Books. In addition there are three small scraps from the Antinoopolis papyrus, while some headings and lemmata are confirmed by Psellus. Thus chs. 4.2–9, 4.13–17 and 4.19 can be reconstructed from multiple witnesses, but for the remaining chapters we only have P and what is left of his tradition. In the latter case the number and order of the lemmata are fixed as we find them in the tradition of P. At most we can

speculate on how P might have epitomized the material he found in A, in some cases comparing material found in proximate sources and other transmitted doxography or extrapolating from what we know about P's methods elsewhere in his *Epitome* (for example his manipulation of name-labels). In those cases we will speak primarily about P, although it must always be borne in mind that A will be hovering in the background.

2 Subject Matter and Macrostructure

The division of subject matter between Book 4 and Books 3 and 5 on either side is not very strict. Ch. 4.1, on the Nile, belongs with the terrestrial subject matter of the second part of Book 3 (see Introduction to Book 3, section 2). The first chapters of Book 5 could also have been the last of Book 4. The exceptional absence of a prooemium for Book 5 (assuming it has not been lost, which is most unlikely) further underlines the coherence of Books 4 and 5. For the relation between Books 4 and 5 see also below, section 6. The extremely brief prooemium of Book 4 places itself in an *omphalos* position by referring to the treatment of the 'parts' of the cosmos that have been completed (sc. in Books 1–3) and to the 'individual parts', i.e. those pertaining to (mostly) the human being, that are to follow (sc. in Books 4–5), thus emphasizing the coherence of each of the two groups of Books of which the treatise consists as well as the unity of the treatise as a whole. For the divisions and coherence of the treatise see further above, General Introduction, section 2.7.

Thus as a consequence of the inclusion of the Nile, Book 4 consists of two very different and unequal parts, namely ch. 4.1 on the exceptional river and chs. 4.2–23 on the human soul and its properties and functions, or a small hydrological part and a large psychological part.

The psychological part, comprising chapters 4.2 to 4.23, can be divided into three sections:

First: chs. 4.2–7 on the soul per se, i.e. its substance, parts, *hegemonikon*, movement and indestructibility. Groups of chapters that as to a sequential structure according to the categories and question types are comparable to chs. 4.2–7 are found in the present Book and throughout the *Placita*: chs. 4.8–21 on sensation and the senses, 2.1–10 on the cosmos, 2.11–12 on the heaven, 2.12–19 on the stars, 2.20–24 on the sun, 2.25–30 on the moon, 3.9–15 on the earth, and 5.3–14 on semen and insemination.

Secondly: chs. 4.8–21 on epistemology, i.e. the senses in general, sense-perception and its reliability, the number of the senses, two chapters on sensation and concept formation according to the Stoics, six chapters on the

individual senses (but lacking one on touch!), two chapters on voice, and an addendum on the Stoic view of soul including sense perception and origin of concepts;

And third: two further addenda, ch. 4.22 on a particular psycho-somatic theme and ch. 4.23 on psycho-somatic relations in general.

The position of ch. 4.11, on the genesis of sense perceptions and the origin of concepts, and of 4.12, on the different senses of impression, impressor, imagination, and figment, *after* ch. 4.9 on the reliability of sense perceptions and presentations, is odd from a systematic point of view, and reveals that these two exclusively Stoic chapters have been inserted later at the end of the close-knit block of chs. 4.8–10, which deals with the senses in general and presents a variety of views in the usual dialectical way. We notice a comparable attempt at upgrading the psychology at the end of the account of the senses, after that of the close-knit block of chs. 4.13–20, which comprises the individual senses plus voice and also presents varieties of views. For ch. 4.21 adds a further Stoic account of the genesis and processes of sense perception and concept formation, and of the structure of soul and function of its regent part. To some extent this duplicates paragraphs in earlier chapters. On these added chapters and similar Stoic upgrades in Book 4 see Diels *DG* 61, 101, 178, and 182, where he omits this material from his reconstructed *Vetusta placita*. The fact that ch. 4.11 shows unmistakable symptoms of *abridgement* (Mansfeld 2013b) proves that it is Aëtian, P having epitomized his source in his usual way. In chs. 4.11 and 4.21 concept formation follows organically, so to speak, upon sense perception, and is integrated in the treatment of soul as a whole. The Stoic doctrine contains ingredients such as the formation of concepts from other concepts that are lacking in Aristotle. From the point of view of completeness and clarity, and so also from a didactic point of view, their doctrine is therefore superior to that of Aristotle, which explains its presence in Book 4. Diels saw this upgrading of the living text by the addition of Stoic material as a sign of decadence and a corruption of the genuine *Placita* method (see M–R 1.99–100). But a comparison with the proximate tradition shows that the rich Stoic material in A Book 4 is meant to be representative.

3 Name Labels

The number of different name-labels is very high, namely 61. Most of these, as usual, are of philosophers, but there also three scientists: Aristarchus, Eudoxus, and Euthymenes; four doctors: Asclepiades, Erasistratus, Herophilus, and Hippocrates; and even two historians: Ephorus and Herodotus. This is a little

deceptive, since three of these, Euthymenes and the two historians, are only found in the exceptional ch. 4.1 'On the rising of the Nile'. Unusual name-labels are also found in ch. 3.17, likewise dealing with a subject not treated by Aristotle. The number of collective name-labels is definitely higher than usual: Academics 4, Peripatetics 5, Pythagoreans 2, *mathematikoi* 1, and of course the ubiquitous Stoics, found no less than 17 times. Hellenistic name-labels are found esp. in chapters 1 to 10, and the extent to which individual chapters have been upgraded is clear from the presence of the name-labels Asclepiades in ch. 4.2.8, Xenarchus in ch. 4.3.10 (the latest philosopher in the entire work) and Posidonius in ch. 4.13.11, while Herophilus in ch. 4.22.3 and his colleague physician Asclepiades in ch. 4.22.2 anticipate the massive presence of doctors in Book 5, with its focus on physiology. There are seven standard cases of anonymous 'some' or 'others', with three specific anonymous groups at ch. 4.9.10. There is also a quite, but not exceptionally high number of multiple name-labels per doxa—just as in Books 1 and 2—, as follows: seven times 2 and 3 names, twice 6 and 5 names, and once even a series of 11 names (ch. 4.9.1 on that the senses are false).

4 Successions and Historical Presentation

With regard to historical information we notice that the absolute chronology is pretty standard, with a peak in the fifth cent. BCE. Successions play a subordinate role, Thales occurring only twice, i.e. in first position in chs 4.1.1 and 4.2.1, while Pythagoras, updated more frequently than Thales, gets initial positions in five chapters, namely 4.4.1, 4.7.1, 4.7a.1, 4.9.1, and 4.20.1 (in all cases in combination with Plato and Aristotle). With regard to the relative contributions of dialectic and historiography the Book is intermediate between Book 2 (most dialectical) and Book 3 (most historical). On the other hand it is most similar to Book 1 in respect of what name-labels are mostly used, so it may be considered more philosophical. For sections 2–4 see further the statistics and analysis of Jeremiah (2018) at M–R 4.322–336 and 354 ff.

5 Proximate Tradition

The proximate tradition is very rich, with as its most important representatives Diogenes Laertius, Lucretius, and Tertullian *De anima*.

The parallels of the Laertian physics section are found at the beginning as well as in the later part of our Book 4, namely (a) in the block of chapters about

the soul per se and (b) in that about the mechanics of perception by the individual senses, as follows:

- (a) soul per se: ch. 4.3.3 corporeality, substance ~ Diogenes Laertius *V.P.* 7.156 ll. 1349–1350 + 1352–1354 (lines as in Dorandi); ch. 4.4.4 parts ~ *V.P.* 7.157 ll. 1358–1360 (also in the ethics section: *V.P.* 7.110 ll. 811–813); ch. 4.5.7 regent part in the heart ~ *V.P.* 7.159 ll. 1386–1388; ch. 4.7.3 destructibility, various views about temporary survival ~ *V.P.* 7.156 ll. 1351–1352 + 157 ll. 1355–1357.
- (b) mechanics of perception: ch. 4.15.3 vision ~ *V.P.* 7.157 ll. 1360–1366; ch. 4.19.4 hearing (not in ch. 4.16!) *V.P.* 7.158 ll. 1366–1370.

The rich parallels in Lucretius, for which see Runia at M–R 4.411–412, are important, because they antedate A's account by more than a century and so provide information about the tradition to which A is indebted. Tertullian's source Soranus derives from the same or a similar *fons uberior*. The Lucretian parallels also strongly suggest that as to the presentation and elucidation of doctrine the poet is not a mere parrot of his master, or Epicurean fundamentalist. We do, however, have to take into account that according to a *Scholion* on the *Epistle to Herodotus* (at Diogenes Laertius *V.P.* 10.66) Epicurus himself 'in some other work' (ἐν ἄλλοις) successively treated the substance of the soul (cf. ch. 4.3), its division into parts and the presence of the regent part in the chest (cf. ch. 4.4.7), sleep (cf. ch. 5.14), and the provenance of semen (cf. ch. 5.3). This Epicurean sequence and its contents are remarkably parallel to the section of the Stoic account cited above, so one wonders who came first. However this may be, a template, deriving from Epicurus himself and comparable to what is in *DRN*, will have been available to Lucretius, whose more detailed and up-to-date exposition could be justified by reference to the authoritative archegete. For the situation in Book 3 see the Introduction to Book 3, section 5.

Parallels between individual chapters of A (in succession 4.3, 4.5, 5.24, 5.25, 4.7, 4.4) and Tertullian's *De anima* (c. 15, c. 43, c. 54, c. 14), arranged as always in double columns, are discussed by Diels *DG* 203–207. Since Diels it has been accepted that Tertullian is indebted to the *On the Soul* of the second cent. Methodist doctor Soranus, whom he cites several times. Soranus, in his turn, is indebted to the earlier doxographical tradition. The first to provide a list in two columns of the overall *structural* parallels between Tertullian and A Books 4 and 5, one that was also more complete than the evidence furnished by Diels, was Karpp (1934) 42–43. Karpp's list was amplified by Waszink (1947) 31–32, who not only added further details but also a column of references to Diels' reconstruction of the so-called *Vetusta placita*, apparently because in A parallels for a number of details in Tertullian are lacking. He was followed by Festugière (1953) 5–6, who omitted the *Vetusta placita* column. Schrijvers (1976) 233–234 = (1999) 122–123 was the first to add an overview of the important

structural parallels in Lucretius Books 3 and 4 to the Aëtian-cum-Tertullian list, but unnecessarily came up with a third column containing parallels in Junius Martianus Rota's unreliable Latin translation of 1541–1542 of ps.Galen's *Historia philosopha* as reprinted in Kühn 1830 (for details see M–R 1.23–24). In the relevant chapters G of course merely excerpts P. Doxographical-dialectical parallels between Lucretius and A Book 4 (and some others) were discussed by Mansfeld (1990a) 3143–3154. The parallels between all of these accounts, as well as the Aristotelian background (on which see below) are discussed in some detail in M–R 2.139–153.

Substantial parallels for these proximate sources of A's material are also to be found elsewhere. Among these sources the most prominent are Cicero *Lucullus* and *Tusculans*, Philo *De somniis*, Arius Didymus, Galen *De placitis Hippocratis et Platonis*, Alexander(?) *De anima mantissa*, Tertullian *De anima*, Iamblichus *De anima*, Porphyry *De anima*, Macrobius *in Somnium Scipionis*, Nemesius, Psellus *De omnifaria doctrina*, and the *Commentaria in Dionysium Thracem*.

6 Other Source Material

We noted already above that the post-Aristotelian topic of the rising of the Nile has been placed in ch. 4.1 at the beginning, as close as possible to the presentation of the sea in Book 3. In contrast, the organization of the account of the soul per se is mostly based on Aristotle's *On the Soul*, and that of sense-perception on the *On the Soul* and its appendix, the *Parva naturalia*. This exposition has been upgraded by the insertion of more advanced epistemological material that is exclusively Stoic, for which see further below. The two final chapters, on respiration and the relation between bodily affections and the soul, reflect the separate account of respiration in the *Parva naturalia* and their focus on what is common to soul and body (Arist. *Sens.* 1), thus anticipating the account of themes of a similar nature and with the same antecedents in the next Book.

Diogenes Laertius *V.P.* 7.133 reproduces the contents of the αἰτιολογικόν, the third subpart of the second main division of the Stoic diaeresis of the *physikos logos*, for which see M–R 2.1.105–106 and above, General Introduction section 2.8. This subpart is again divided into two parts. Issues contained in the former of these parts are studied by physicians as well as philosophers, among which that of the location of the regent part of the soul, cf. ch. 4.5, those concerned with 'what happens in the soul', relevant for the whole of chs. 4.8–22, and those 'concerning seeds'. So we have both psychology and spermatology in the same subpart of the division, which further illustrates the close relationship between Books 4 and 5. Issues contained in the second of these parts are studied by

mathematikoi as well as philosophers, such as ‘how we see’ cf. ch. 4.13, ‘what is the cause of the presentation in the mirror’ cf. ch. 4.14, followed surprisingly by meteorological subjects, for which see Introduction to Book 3 section 7.

The treatment of sense-perception, including the epistemological issue of its trustworthiness, in the context of psychology as part of physics agrees with Aristotle’s procedure in the *On the Soul* and *Parva naturalia*. (Our discussion in M–R 2.1.138–139 is too cautious.) We further know that Book 2 of Theophrastus’ *De anima* also counted as Book 5 of his *Physics* (Themistius in *de An.* 108.11 = Theophrastus fr. 307A FHS&G). And his *De sensibus* belongs with physics too, even if it were part of the *Physikai Doxai*, for the latter, as the title shows, certainly belongs with physics. In Aristotle the part of epistemological theory that deals with concept formation in some detail is found dispersed over various places, not only in the *On the Soul*. The interpretation of these passages is not easy; the doctrine is not presented in a systematic way, and the various accounts are not fully, or at least not easily, compatible with each other. Aristotle moreover fails to explain the origin of concepts in and from other concepts. In the *On the Parts of Animals* 1.1 641a33–b10 the study of intellect insofar as it is related to the objects of thought, which perhaps amounts to the study of the objects of thought themselves, is excluded from physics (cf. *Met.* Z.1 1025b27–30). This would appear to be in conflict with what happens in the *On the Soul* (on this controversial passage see Kullmann 2007, 309–311, with references to the discussion). This may help to explain the preference for the Stoic account in the *Placita*.

Epistemology was treated systematically by Chrysippus in at least two treatises belonging to the *physical* part of philosophy, namely his *Physics* and his *On the Soul*. Diogenes Laertius cites the second Book of the *On the Soul* for the explanation of what is meant by an imprint, *typôsis*, in the soul (*V.P.* 7.50, *SVF* 2.55). The second Book of the *Physics* is cited as the *locus classicus* for the cataleptic impression (*kataleptikê phantasia* as the criterion *V.P.* 7.54, *SVF* 2.105)—though disagreeing with himself he also mentioned sense perception and preconception (*prolepsis*) as criteria in Book 1 of his *On the Logos* (*V.P.* 7.54, *SVF* 2.105). This title is cited in the ethical section of his catalogue, along with other titles that indicate epistemological topics (*V.P.* 7.201, *SVF* 2.17 p. 9.24–30). The second Book of his *Physics* is also cited for the view that ‘voice’ is corporeal (*V.P.* 7.55, *SVF* 2.140). Diogenes of Babylon cited Zeno’s argument about the location of mind and speech in the heart at the beginning of his *On the Regent Part of the Soul* (Galen *PHP* 2.5.7, *SVF* 1.148, *SVF* 3 Diog. 23; cf. Galen *PHP* 2.5.12, *SVF* 3 Diog. 29 on voice). These descriptions of what goes on in the soul and its regent part fill out the brief account of the psychological subpart of physics at Diogenes Laertius *V.P.* 7. 133 cited above (‘the inquiry, according to which

they inquire about the *hegemonikon* and the things that happen in the soul'). It follows that the position of the epistemological chapters and paragraphs concerned with the Stoics in A's psychological Book 4 agrees rather well with Chrysippus' and Diogenes of Babylon's practice in the physical part of philosophy. To be sure, Zeno, Chrysippus, Archedemus and Eudromus placed 'logic' first in the order of the three parts of philosophy, but we may feel sure that this 'logic' (or 'dialectic') did not include epistemology.

Note on the other hand that Diogenes Laertius *V.P.* 7.42–52 includes treatment of *phantasiai* (even qua imprint in the soul, 7.46) and truth in the *dialectical* part of philosophy, i.e. not in physics but in logic. Also see Diocles at Diogenes Laertius *V.P.* 7.49, who tells us that the Stoics are agreed to *begin* with the theory of impression and sense perception. This is quite different from the position of these themes in Chrysippus and in A, but has to be seen as a later, though of course not illogical development. Because the *Placita* are a physical treatise (cf. *physikos logos*, ch. 1.0a.1[1]) and not a systematic *logos* of philosophy that like ps.Galen's *Historia philosopha* begins with logic or dialectic, the epistemological ingredients could not be accommodated at its beginning—say, after the introductory section on the parts of philosophy in the prooemium of the treatise, just as they are in Diogenes Laertius after *V.P.* 7.39–41. They were not so accommodated, at any rate.

7 Other Parallels and Sources

For the ultimate sources of much of the material contained in the Book we must go back to the Peripatos, and think of the otherwise lost sources used by Aristotle, Theophrastus and their predecessors. Ch. 4.1 on the Nile is dependent on the accounts of Herodotus and ps.Aristotle's *De inundacione Nili*, a characteristic it shares with the widespread tradition on this subject. It is also evident that ultimately the sources that A drew on for his psychology had access to Presocratic material (in some cases their actual works). Plato's *Timaeus* (and *Philebus*) furnish material for the twelve doxai attributed to him in the book, though these have as a rule been modernized. Chapters on the individual senses are to some extent related to Theophrastus *De sensibus*, as will be discussed at the relevant chapters. For many of the chapters it emerges that the general approach, the title and some of the lemmata go back to Aristotle's *On the Soul* and *Parva naturalia*.

The wider doxographical tradition, as for instance exemplified by Cicero *Tusc.* 1.19–21 and elsewhere in the same book, treats the themes of the soul's substance, its mortality versus its immortality, and the location of its regent

part simultaneously. At a first glance the *Placita* separates these themes rather rigorously, as is clear from the chapter headings and the contents of the chapters themselves. But some traces of a less rigorous separation remain. In ch. 4.2, on the substance of soul qua incorporeal, Alcmaeon's soul is said at 4.2.2 to be 'immortal' (ἀθάνατον), thus anticipating the theme of ch. 4.7. Also note that the various references to movement at ch. 4.2.1–5 anticipate the theme of ch. 4.6. The impression that A depends on an anterior treatment that was a bit less 'pedantically' scholastic is unavoidable. The emphasis may be different from Aristotle's too; e.g. the focus on the *hegemonikon* is Hellenistic and not earlier. Later Hellenistic sources are also utilized, as proven by chapters 11–12 and 21, which exceptionally derive from Stoic sources alone, and by the focus on Stoic doctrine in other chapters.

Liber 4 Titulus et index

Commentary

A Witnesses

As discussed in the equivalent chapter of Book 1, for the title of the entire work and its individual books we must rely on the evidence of T, the only witness to cite the title of the original work and give the name of its author. The titles in P and those witnesses dependent on its tradition are expanded versions of the original title. The title at the head of this Book in P^B is the shortest of the five, omitting the preposition Περὶ at its beginning and making no reference to the *epitome* character of the work. The title in Q's translation is also short. On these titles see further Book 1 titulus et index Commentary C.

For the index of chapters P^B is the chief witness, though not all mss. contain it. One of the mss. of Q, Zāhiriya (Damascenus) 4871 contains a translation of the list and thus provides valuable additional evidence on the manuscript tradition. Daiber did not include it in his edition, but he has kindly provided the editors with a translation (see Appendix in Vol. 4). On this translation and its source see further the Book 1 titulus et index Commentary A.

Eusebius only cites two chapters from this book, chs. 4.4–5, at PE 15.60–61. For the latter he gives a shortened heading in both the index to Book 15 and in the excerpt itself, but a longer (but not complete) version in his summary at PE 15.32.10. Symeon Seth also mentions some headings from this book in his

summary of the contents of his Book 4 which takes the place of an index. For both texts, see above, Book 1 titulus et index *testes primi*.

For the question whether A's text contained the index see Book 1 titulus et index Commentary D. On the practice of prefacing texts with tables of content and chapter headings see Book 1 titulus et index Commentary D(e).

C *Book Title*

See above, section A. On how this title relates to the title of the original work see Book 1 titulus et index Commentary C.

D *Analysis of the Index*

(1) For a discussion giving the reasons why we are convinced that A's original compendium contained these indices at the beginning of each book, see M–R 2.196–204 and Book 1 titulus et index Commentary D(6) and D(e).

(2) For the methodology of the reconstruction of the index see Book 1 titulus et index Commentary D(3). We argue that priority must be given to the chapter headings in the text of the chapters themselves, since A will have based his index on these when he compiled the work. It is thus to be assumed that the list of chapter headings in the index accurately reflects the chapter headings in the text of the Book. In case of this book there is a strong correlation between the headings in the index and those in the text of the chapters themselves, with only the heading of 4.7a, a chapter which P omitted, to be added and a very slight discrepancy between the heading in the pinax as preserved in the mss. (αὐτοῖς) and the intra-textual heading (τούτοις).

(3) In this book Q also adheres rather closely to the headings as transmitted in the mss. tradition, but as can be seen in the app. crit. above there are a number of variants, mostly omissions and simplifications, but in the case of ch. 4.2 an expansion, altering the simple umbrella heading with Περὶ to a heading asking what the soul's definition is. This is no doubt an innovation of the translator Qustā. For the headings in Eusebius, see section A above.

D(e) *Other Evidence*

For further discussion on the use of *pinakes* (tables of contents) in ancient works see Book 1 titulus et index Commentary D(e).

In section E Further related texts below, we present a selection of texts ranging from Chrysippus to the very end of antiquity in which subjects relating to psychology are set in terms more or less reminiscent of the list of headings in A's Book 4. On the groupings of themes that correspond to the contents of the Book see also above, Introduction to Book 4. Selected passages will be repeated at the relevant chapters. On these texts in general see also Mansfeld (1990a). A

separate study was devoted to the important evidence of the Chrysippus text; see Mansfeld (1989a). The passages in Philo also go back to doxographical traditions anterior to A; see further Book 2, Introduction, and ch. 2.11 Commentary B(1).

E Further Related Texts

a Proximate Tradition

Chrysippus *de An.* 1 verbatim at Gal. *PHP* 3.1.9–16 λέγω δὴ ὅτι ὁ Χρύσιππος (*SVF* 2.885) κατὰ τὸν πρῶτον αὐτοῦ Περί ψυχῆς λόγον τῶν μερῶν αὐτῆς τοῦ ἡγεμονικοῦ μνημονεύει ἀρχόμενος, ἐνθα δὴ δεικνύει πειράσθαι τὴν ἀρχὴν τῆς ψυχῆς ἐν τῇ καρδίᾳ μόνῃ περιέχεσθαι οὕτως λέγει· ‘ἡ ψυχὴ πνεῦμά ἐστι σύμφυτον ἡμῖν συν-εχὲς παντὶ τῷ σώματι διήκον ἔστ’ ἂν ἡ τῆς ζωῆς εὐπνοία παρῇ ἐν τῷ σώματι (cf. ch. 4.3.3). ταύτης οὖν τῶν μερῶν ἐκάστῳ διατεταγμένων μορίῳ τὸ διήκον αὐτῶν εἰς τὴν τραχείαν ἀρτηρίαν φωνὴν εἶναι, τὸ δὲ εἰς ὀφθαλμοὺς ὄψιν, τὸ δὲ εἰς ὠτα ἀκοήν, τὸ δ’ εἰς ῥίνας ὄσφρησιν, τὸ δ’ εἰς γλῶτταν γεῦσιν, τὸ δ’ εἰς ὄλῃν τὴν σάρκα ἀφήν καὶ τὸ εἰς ὄρχεις ἑτέρον τιν’ ἔχον τοιοῦτον λόγον, σπερματικόν, εἰς ὃ δὲ συμβαίνει πάντα ταῦτα ἐν τῇ καρδίᾳ εἶναι, μέρος ὃν αὐτῆς τὸ ἡγεμονικόν (cf. ch. 4.4.4). οὕτω δὲ ἐχόντων αὐτῶν τὰ μὲν λοιπὰ συμφωνεῖται, περὶ δὲ τοῦ ἡγεμονικοῦ μέρους τῆς ψυχῆς διαφωνοῦσιν ἄλλοι ἐν ἄλλοις λέγοντες αὐτὸ εἶναι τόποις (cf. ch. 4.5). οἱ μὲν γὰρ περὶ τὸν θώρακα φασιν εἶναι αὐτό, οἱ δὲ περὶ τὴν κεφαλὴν. κατὰ τὰ αὐτὰ δὲ ταῦτα διαφωνοῦσι, ποῦ τῆς κεφαλῆς καὶ τοῦ θώρακος ἐστίν, οὐ συμφωνοῦντες αὐτοῖς. Πλάτων δὲ καὶ τριμερῆ τὴν ψυχὴν φήσας εἶναι τὸ μὲν λογιστικόν ἔλεγεν ἐν τῇ κεφαλῇ εἶναι, τὸ δὲ θυμοειδὲς περὶ τὸν θώρακα, τὸ δὲ ἐπιθυμητικόν περὶ τὸν ὀμφαλόν. οὕτω φαίνεται διαφεύγειν ὁ τόπος ἡμᾶς οὐτ’ αἰσθήσεως ἐκφανοῦς γενομένης, ὅπερ ἐπὶ τῶν λοιπῶν συντετύχηκεν, οὔτε {τῷ} τῶν τεκμηρίων δι’ ὧν ἂν τις συλλογίσαιτο τοῦτο· οὐδὲ γὰρ ἂν ἀντιλογία ἐπὶ τοσούτον προήλθεν καὶ ἐν ἰατροῖς καὶ ἐν φιλοσόφοις.’ αὕτη πρώτη ῥῆσις γέγραπται ὑπὸ Χρυσίππου περὶ ἡγεμονικοῦ κατὰ τὸ πρότερον Περί ψυχῆς. τὸ μὲν γὰρ ἡμῖς μέρος αὐτῷ τῆς βίβλου τὸ πρότερον ὑπὲρ οὐσίας ψυχῆς ἔχει τὴν σκέψιν. **Cicero** *Luc.* 124 *tenemusne quid sit animus* (cf. chs. 4.2–3)? *ubi sit* (cf. chs. 4.4–5)? *denique sitne an ut Dicaearchus* (fr. 8(f) Wehrli, 17 Mirhady) *visum est ne sit quidem ullus? ... si simplex* (cf. ch. 4.4), *utrum sit ignis an anima an sanguis* (cf. ch. 4.3) *an ut Xenocrates* (fr. 67 Heinze, F 121 Isnardi Parente²) *numerus nullo corpore, quod intellegi quale sit vix potest* (cf. ch. 4.2)? *Tusc.* 1.18 *quid sit porro ipse animus* (cf. chs. 4.2–3) *aut ubi* (cf. chs. 4.4–5) *aut unde* (cf. ch. 4.5a), *magna dissensio est.* **Philo** *Somm.* 1.30–32 ἄρ’ οὖν καὶ τὸ τέταρτον τῶν ἐν ἡμῖν αὐτοῖς, ὁ ἡγεμὼν νοῦς, καταληπτὸς ἐστίν; οὐ δῆπου. τί γὰρ αὐτὸν οἰόμεθα κατὰ τὴν οὐσίαν εἶναι; πνεῦμα ἢ αἷμα ἢ σῶμα συνόλως (cf. ch. 4.2)–ἀλλ’ οὐ σῶμα, ἀσώματον δὲ λεκτέον—ἡ πέρας ἢ εἶδος ἢ ἀριθμὸν ἢ ἐνδελέχειαν ἢ ἀρμονίαν ἢ τί τῶν ὄντων (cf. ch. 4.3); (31) γεννώμενον δ’ εὐθύς ἢ ἔξωθεν εἰσκρίνεται ἢ ὑπὸ τοῦ περιέχοντος ἀέρος ἢ ἐνθερμος ἐν ἡμῖν φύσις οἷα σίδηρος ἐν χαλκῷ πεπυρωμένος ὕδατι ψυχρῷ πρὸς τὸ κραταιότατον στομοῦται (cf. ch. 4.5a); διότι καὶ παρὰ τὴν ψύξιν ὠνομάσθαι ψυχὴ δοκεῖ. τί δέ; τελευτώντων σβέννυται καὶ συμφθεῖρεται τοῖς σώμασιν ἢ πλείστον ἐπιβιοῖ χρόνον ἢ κατὰ τὸ παντελὲς ἄφθαρτόν ἐστι (cf. ch. 4.7); (32) ποῦ δ’ ἐμπεφύλευκεν ὁ νοῦς αὐτῷ; ἄρα οἶκον κεκλήρωται; οἱ μὲν γὰρ τὴν ἀκρόπολιν ἐν ἡμῖν

ἀνιέρωσαν αὐτῷ κεφαλὴν, περὶ ἣν καὶ αἱ αἰσθήσεις λοχῶσιν, εἰκὸς εἶναι νομίσαντες ἐγγὺς οἷα μεγάλου βασιλέως ἐφεδρεῦειν τοὺς δορυφόρους· οἱ δ' ὑπὸ καρδίας αὐτὸν ἀγαματοφορεῖσθαι διανοηθέντες γνωσιμαχοῦσιν (cf. ch. 4.5). *Cher.* 114 ποῦ γάρ μου τὸ σῶμα πρὸ γενέσεως ἦν; ποῖ δὲ καὶ χωρήσει μεταστάντος (μου); ποῦ δὲ καὶ τοῦ δοκοῦντος ὑφεστάναι τῶν ἡλικιῶν αἱ διαφοραί; ποῦ τὸ βρέφος, ποῦ ὁ παῖς, ποῦ (ὁ) ἀντίπαις, ποῦ ὁ ἄρτι ἡβῶν, ποῦ τὸ μεираκιον, ὁ πρωτογένειος, ὁ νεανίας, ὁ τέλειος ἀνὴρ (ch. ch. 5.23); πόθεν δὲ ἦλθεν ἡ ψυχὴ (cf. ch. 4.7a), ποῖ δὲ χωρήσει, πόσον δὲ χρόνον ἡμῖν ὁμοδαίτος ἔσται (cf. ch. 4.7); τίς δὲ ἐστὶ τὴν οὐσίαν, ἔχομεν εἰπεῖν (cf. chs. 4.2–3); πότε δὲ καὶ ἐκτησάμεθα αὐτήν; πρὸ γενέσεως; ἀλλ' οὐχ ὑπάρχομεν· μετὰ τὸν θάνατον; ἀλλ' οὐκ ἐσόμεθα οἱ μετὰ σωμάτων σύγκριτοι ποιοί, ἀλλ' εἰς παλιγγενεσίαν ὁρμήσομεν οἱ μετὰ ἄσωμάτων σύγκριτοι ποιοί. **Tertullian de An.** 3.2 *proinde enim et animae ratio* (sc. concussa est) *per philosophatas doctrinas hominum miscentes aquas vino* (Is. 1:22): *alii immortalem negant animam, alii plus quam immortalem adfirmant* (cf. ch. 4.7), *alii de substantia, alii de forma* (cf. chs. 4.2–3), *alii de unaquaque dispositione disceptant; hi statum eius aliunde (de)ducunt* (cf. ch. 4.5a), *hi exitum aliorum abducunt* (cf. ch. 4.7). *de An.* 5.1–6.1 *fortassean extruentur magis ad auferendam animae corpulentiam, si non alios e contrario inspexerint, et quidem plures, corpus animae vindicantes* (cf. chs. 4.2–3). (5.2) *nec illos dico solos qui eam de manifestis corporalibus effingunt, ut Hipparchus et Heraclitus ex igni, ut Hippon et Thales ex aqua, ut Empedocles et Critias ex sanguine, ut Epicurus ex atomis (si et atomi corpulentias de coitu suo cogunt), ut Critolaus et Peripatetici eius ex quinta nescio qua substantia (si et illa corpus, quia corpora includit), sed etiam Stoicos allego, qui spiritum praedicantes animam paene nobis cum, qua proxima inter se flatus et spiritus, tamen corpus animam facile persuadebunt* (cf. ch. 4.3). (5.3) *denique Zeno consitum spiritum definiens animam hoc modo instruit. quo, inquit, digresso animal emoritur, corpus est; consito autem spiritu digresso animal emoritur, ergo consitus spiritus corpus est; ergo corpus est anima* (cf. ch. 4.7). (5.4) *vult et Cleanthes non solum corporis lineamentis, sed et animae notis similitudinem parentibus in filiis respondere, de speculo scilicet morum et ingeniorum et adfectuum, corporis autem similitudinem et dissimilitudinem capere et animam, (animam) itaque corpus similitudini vel dissimilitudini obnoxium* (cf. ch. 5.11). (5.5) *item corporalium et incorporalium passiones inter se non communicare; porro et animam compati corpori, cui laeso ictibus vulneribus ulceribus condolescit, et corpus animae, cui afflictae cura angore amore coaegrescit per detrimentum socii vigoris, cuius pudorem et pavorem rubore atque pallore testetur* (cf. ch. 4.2–3). *igitur anima corpus ex corporalium passionum communione.* (5.6) *sed et Chrysippus manum ei porrigit constituens corporalia ab incorporalibus derelinqui omnino non posse, quia nec contingantur ab eis (unde et Lucretius (DRN 1.304): 'tangere enim et tangi nisi corpus nulla potest res'), derelicto autem corpore ab anima affici morte. igitur corpus anima, quae nisi corporalis corpus non derelinquet.* (6.1) *Haec Platonici subtilitate potius quam veritate conturbant.* **Hermias Irr.** 2–3 οἱ μὲν γάρ φασιν αὐτῶν ψυχὴν εἶναι τὸ πῦρ, οἱ δὲ τὸν ἀέρα, οἱ δὲ τὸν νοῦν, οἱ δὲ τὴν κίνησιν, οἱ δὲ τὴν ἀναθυμίασιν, οἱ δὲ δύναμιν ἀπὸ τῶν ἄστρον ῥέουσιν,

οἱ δὲ ἀριθμὸν κινήτικόν, οἱ δὲ ὕδωρ γονοποιόν, οἱ δὲ στοιχεῖον (ἦ) ἀπὸ στοιχείων, οἱ δὲ ἀρμονίαν, οἱ δὲ τὸ αἷμα, οἱ δὲ τὸ πνεῦμα, οἱ δὲ τὴν μονάδα, καὶ οἱ παλαιοὶ τὰ ἐναντία (cf. chs. 4.2–3). πόσοι λόγοι περὶ τούτων, ἐπιχειρήσεις πόσαι, πόσαι δίκαι σοφιστῶν ἐριζόντων μᾶλλον ἢ τάληθές εὐρισκόντων; ἀλλὰ γὰρ ἔστω· στασιάζουσι μὲν περὶ τῆς ψυχῆς ... τὴν δὲ φύσιν αὐτῆς, οἱ μὲν ἀθάνατόν φασιν, οἱ δὲ θνητὴν, οἱ δὲ πρὸς ὀλίγον ἐπιδιαμένουσιν, οἱ δὲ ἀποθνήσκουσιν αὐτήν, οἱ δὲ εἰς ἀτόμους διαλύουσιν (cf. ch. 4.7).

Commentary

A *Witnesses*

The only witnesses are P^B, so we have to follow the text as transmitted there.

C *Chapter Heading*

No chapter heading is needed for a proem. We have added the word ⟨*Proœmium*⟩ to the text and translation for the sake of clarity.

D *Analysis*

a Context

The proem looks back on Books 2 and 3 and forward to the contents of Books 4 and 5 and thus is placed in the *omphalos* position as regards these preceding and following Books.

b Number–Order of Lemmata

There is only one lemma.

c Rationale–Structure of Proœmium

See section D(a) above and Introduction to Book 4, section 2. On this passage as an authorial comment see also M–R 2.1.50–51.

e Other Evidence

See below section E(b)

Commentary

A *Witnesses*

The witnesses are P and his tradition, represented by P^B, P^G, P^Q and (for the heading only) P^{Ps}. Nothing is found in S. It is possible that he found a place for it in *Ecl.* 1.39 Περὶ ὑδάτων, but this chapter survives only, it seems, in a severely truncated form with only a single long Aristotelian lemma taken from AD.

T 4.62 (cited section E(a) General texts) refers to the discussion, but as pointed out by Raeder (1900) 90, there is no verbal parallelism ('cum Aetianis ... fortasse cohaeret, sed in verbis plurimum differt').

B *Proximate Tradition and Sources*

(1) *Proximate tradition.* The proximate tradition is varied and rich and consists of lists and even discussions of name-labels and doxai (often including arguments contra) in a multiplicity of authors, of whom we may mention Diodorus Siculus, Seneca, and Lucan, Ammianus Marcellinus, *scholia* on Apollonius Rhodius, and the so-called *Anonymus Florentinus* (FGrH647 F1). Excerpts in a Greek translation from both the extant and the lost part of *Naturales quaestiones* Book 4a are extant in Ioannes Lydus, see Diels *DG* 228 n. 3 and Gross (1989) 174–178 (the suggestion of Williams 2008 of a common source for Seneca and Ioannes Lydus is unfounded, cf. Hine 1996, 187–189. Because Ioannes Lydus' excerpts from the extant part are not always exact, one should be careful with those from the lost part). Seneca states that he will begin the overview of the doxai concerned with the inundation of the Nile, starting with the most ancient authorities: *Nat.* 4.2.17 *sed nunc ad inspiciendas causas propter quas aestate Nilus crescat accedam et ab antiquissimis incipiam*. As has been often pointed out, however, unlike A and most other parallel sources he does not begin with Thales (who comes a little later at *Nat.* 4a.2.22) but, like the scholiast on Apollonius Rhodius, with Anaxagoras and the three tragic poets (*Nat.* 4a.2.17). 'All of antiquity (*omnis vetustas*)', he affirms, agrees with Anaxagoras. The 'Posido-

nian doxography', as Kidd (1999) 295 formulates the heading of his translation of F 222 E.-K. (Greek text cited below at section E(a)§1), has a different set of names.

(2) *Sources*. The contents of §§1–3 go back at least as far as Herodotus 2.20–23, where these doxai are anonymous and follow each other in exactly the same order as in A. Herodotus may have used a source of Sophistic provenance. §5 with name-label summarizes Herodotus 2.24–25, so derives from an intermediate source too. The little Peripatetic treatise *On the Inundation of the Nile* (*Liber Aristotelis De inundacione Nili*), attributed to Aristotle (see below), is extant in a mediaeval Latin translation and a few fragments on papyrus. The text is printed as Aristotle frs. 246–247 Rose³; see esp. the new edition by Beullens (2014) 325–329, who keeps Rose's page and line numbers. Some of A's name-labels and doxai are absent from this treatise, though on the other hand it contains name-labels and doxai not found in A. Shared are four items concerned with early name-labels and doxai, namely Thales plus doxa, Anaxagoras plus doxa, the doxa of Euthymenes without name-label, and (significantly) Herodotus plus doxa. The relative order of these shared doxai is the same, although in A we have §4 Democritus between §3 Anaxagoras and §5 Herodotus, and in ps.Aristotle Diogenes between Thales and Anaxagoras, as well as two further doxai (Athenagoras, Nicagoras) between Anaxagoras and Herodotus. Nevertheless ps.Aristotle may be numbered not only among the representatives of the proximate tradition but also, possibly, among the sources of A. We note that the little treatise does not begin in the manner of a dialectical discussion but in the way of the Aristotelian/Peripatetic *Problemata*: *propter quid* = διὰ τί; 'why?', the question type of cause. The dialectical discussion is announced further down, 'we shall speak of the things that are extant as said in the past by those who are in doubt about this issue' (*horum autem qui quidem existunt dicti a prius dubitantibus de ipso, hos nos dicemus*). It is a mistake to compare the tract with the *Problemata* literature alone, for we do not find full-scale doxographies there. See also below at section D(e).

It will be useful to bring the real Aristotle's scattered references together (all quoted at section E(b) below). He does not mention the inundation of the Nile in the *Meteorology*, but may have it in mind when he states (*Mete.* 1.13 350b13–14) that 'the most important of its tributaries flows from the so-called Silver Mountains'. He also mentions the torrential summer rains in Aethiopia at *Mete.* 1.12 349a4–9 (for ῥαγδαία and Aethiopia see below, section D(d)§4), though without speaking of the Nile—so Alexander *ad loc.*, in *Mete.* 53.15–16, eagerly supplies a reference to ἐν τοῖς Περὶ τῆς τοῦ Νείλου ἀναβάσεως, and Olympiodorus in *Mete.* 94.4–17 (cited below, section E(b) General texts) refers to the debate. The allusion to differences of opinion at *Mete.* 2.2 356a25–31 is a little puzzling

because of the presence of a large river that does not behave in the same way as the Nile: the Ister (i.e. Danube) and the Nile travel over great distances and have many tributaries, which is why ‘different explanations are given regarding the sources of each of these rivers’ (περὶ τῶν πηγῶν ἄλλοι λέγουσιν ἐκάστου τῶν ποταμῶν ἄλλας αἰτίας).

At *APo.* 2.15 98a29–33 we read: ‘why does the Nile flow more in the latter part of the month? Because the end of the month is more stormy. Why is the weather stormier then? Because the moon is waning’ (cf. *GA* 2.4 738a20–22). This is not about the exceptional behaviour of the Nile in summer (for the general behaviour of rivers see *Mete.* 1.13 349b7–8, ‘rivers always run higher in winter than in summer’), but belongs with the general explanation of *inter alia* the periodically varying levels of the terrestrial waters at *GA* 4.10 777b17–778a2, quoted above, ch. 3.17 section E(b)§1 and also D(d) further comments §1.

The fuzzy situation in the *pragmateiai* helps to understand why an early follower of Aristotle wrote the Περὶ τῆς τοῦ Νεῖλου ἀναβάσεως. Fowler (2000) attributes the Greek original to Posidonius, but argues that it in its turn is in part based on an earlier Peripatetic tract (by Theophrastus, as also others, e.g. already Valentinus Rose, have suspected, though this is by no means certain; see further Sharples 1998b, 197). The argument of De Nardi (2008) in favour of attribution to Aristotle himself, viz. that (as in the *Meteorology*) the Red Sea and the Persian Gulf are not yet seen as parts of the Indian Ocean, is insufficient. Beullens (2014), who opts for authenticity, follows some of the ancient authors who either literally or by implication attribute the tract to Aristotle, but there is no proof that they were right. It is more likely that, like other supplementary works, such as the *De coloribus* or *De spiritu*, it came to be attributed to Aristotle himself: e.g. by Posidonius F 222 E.-K. (63 Theiler) on the authority of Callisthenes at Strabo 17.1.5, 790C.16–18 (cited at section E(a)§1), by *Anonymus Photii* cod. 249, p. 441a34–b7 (cited at section E(b)§7), and by Alexander in *Mete.* 53.15–16, cited above. The exceptional behaviour of the Nile in summer, *toto caelo* different from the behaviour of all other known rivers, called for exceptional explanations. Intriguing from the point of view of Peripatetic science is the fact that it is an individual phenomenon that has to be explained. This presumably also explains why Aristotle refrained from discussing it in the *Meteorology*: his science does not deal with particulars (e.g. *APo.* 1.18 81b6–7, *de An.* 2.5 417b22–23). Declaring the Nile to be the unique member of a species was apparently impossible. His one reference at *APo.* 2.15 98a31 to the Nile alone still deals with what he takes to be a general phenomenon.

The lack of an orderly discussion in Aristotle himself as precedent helps to explain why the tradition on which A depends had to link up with the pre-Aristotelian treatment of the issue. Aristotle, of course, could have followed

his own advice to ‘make excerpts from the literature’ had he decided differently (*Top.* 1.14 105b13, ἐκλέγειν δὲ χρὴ καὶ ἐκ τῶν γεγραμμένων λόγων); see M–R 2.1.158–162.

NB: Because several names are not paralleled in the *Placita* chapter we most of the time only provide lists of name-labels at section E(a) and (b) General texts, preferring to cite the parallels for the individual doxai at the relevant paragraphs.

C Chapter Heading

The heading given by P^{BQ} is paralleled with insignificant variations in P^G and P^S. It is much more informative than a simple umbrella formula (Περὶ Νείλου) would have been. It allows for the question type of cause and the categories of time and place. It is attested as a book title for Aristotle (i.e. ps.Aristotle) and Theon mathematicus.

D Analysis

a Context

The chapter on the flooding of the Nile is rather isolated at the opening of Book 4, the rest of which deals with psychology including epistemology. This positioning may be explained as a consequence of, on the one hand, the intrusion of P 3.18 (now our A 3.5a) at the end of Book 3 and, on the other, of lack of space at the end of a scroll or perhaps codex containing either Book 3 alone or Books 1 to 3, cf. M–R 1.127–128. P 3.18 is not paralleled in G, whose c. 88 (corresponding to 3.17) is immediately followed by c. 89 (corresponding to 4.1), see ch. 3.5a Commentary A and D(a). Chs. 3.17 and 4.1 indeed belong together, the former dealing with the high and low waters of the sea (possibly not only during the twenty-four-hours period but also in the course of the solar year), the latter with the high and low waters in summer and winter of an exceptional river. As a set the chapters 3.16 plus 3.17 plus 4.1 deal with the terrestrial waters, and they appropriately bring up the rear of the πρόσγεια. Thus ch. 4.1 could serve as a transitional chapter, linking Book 4 to Book 3, though its isolated position at the very beginning remains odd.

Alternatively we may regard ch. 4.1 as, so to speak, a mini-book, corresponding as to its relative self-sufficiency to Seneca, *Nat.* Book 4a on the Nile (originally *Nat.* Book 2), following immediately upon Book 3 on terrestrial waters (originally *Nat.* Book 1). A third possibility, suggested by the proem, is that the Nile is considered to be a particular part of one of the larger parts of cosmos treated in previous books. But the Milky Way, treated in the first chapter of Book 3, is also a particular rather than a general item (for the reasons of its placement at the beginning of the Book see ch. 3.1, Commentary D(a)).

See also General Introduction, section 2.7.

b Number–Order of Lemmata

P^{BQ} has seven lemmata, of which G, who omitted §§6–7, has five. The order of these lemmata rather strictly corresponds to the chronology of the name-labels, a rare phenomenon in the *Placita*. This almost certainly has to do with the history of the independent tradition concerned with the flooding of the Nile. The relative order of §§1–3 and §5 corresponds to that in Herodotus; before the lemma with his name-label (§5) another one, concerned with a virtually contemporaneous Presocratic, has been inserted as §4. The final lemmata, §§6–7, doxai of Ephorus and Eudoxus, are also concerned with near contemporaries. §7, which has Eudoxus citing the (ancient lore of) the Egyptian priests, not unelegantly and perhaps even intentionally links up with §1 on the earliest physicist, Thales, in a sort of ring composition. There is no reason to meddle with the sequence, which is also that of Diels in the *DG*.

c Rationale–Structure of Chapter

The main question-type at issue is that of cause, the διὰ τί (the preposition διὰ occurs in §1 and §5; also cf. the opening words of the *De inundacione Nili: propter quid*, and the use of διὰ and *propter* in the parallel passages, e.g. Seneca *Nat.* 4a.17.2 *causas propter quas*). The categories concerned are those of time: summer, winter, and place: winds from the north in §1, the outer ocean in §2, Aethiopia in §3 (and §4), the far north in §4, Egypt explicitly in §1 and §6 (and by mistake in §4), Libya in §6, and the far south in §7.

The causes of the summer flooding vary from obstructing winds that only blow in summer (§1), snow that melts in summer in the far south (§3), snow that melts in summer in the far north, the clouds then being driven to the far south where they cause heavy rains (§4), evaporation because in summer the sun comes closer (§5), excess production of water locally and further south in summer (§6), and finally production of water in the far south in our summer, when it is winter down there (§7). The sweet water from the Ocean (§2), which is entirely different from the factors listed in the other lemmata, could have figured *ad finem* if the chapter had been set out in the usual way of the *Placita*, where exceptions are often found at the end of chapters. Since the lemmata are arranged in chronological order there is hardly room for such an overarching diaeresis. The date of Euthymenes is uncertain: though sometimes believed to have been a contemporary of Pytheas (between c. 350–300 BCE), it is more likely that he has to be dated to around 500 BCE, see Roller (2010) 133, and Brill's *New Pauly*, s.v. Euthymenes.

Other relations between lemmata: §3, snow in Aethiopia, is opposed to §4, snow in the far north, while §5 and §6 are related because they refer to water from sources (§5) or from the soil as a whole (§6), and the rainy kinds of waters of §7 are opposed to these waters from the earth.

d Further Comments

Individual Points

§2 The doxa of Euthymenes may be connected with the commonly found early belief that the Ocean is the origin of rivers. We note that the lemma fails to provide an explanation of the summer flooding. Euthymenes' belief that the Niger is part of the Nile was imitated in another country: Arrian *An.* 6.1 tells us that Alexander, having seen crocodiles in the Indus, at first believed that the origin of the Nile was somewhere in India, that flowing through the desert it lost its name of Indus, and acquired the name Nile upon coming into another part of the world.

§4 The word ῥαγδαῖα here and at Arist. *Mete.* 1.12 349a6 suggests that Democritus used it and Aristotle cited this when formulating his own view (it is the only instance in the *Corpus Aristotelicum* apart from *Aud.* 803a5, τῶν ὑδάτων τὰ καλούμενα ῥαγδαῖα, where note καλούμενα). This entails that the doxa may have begun its career as an excerpt from a Democritean treatise (the Κοσμογραφίη?). Diels *DG* ad loc., followed by other editors, points out that Αἴγυπτον is a mistake for Αἰθιοπίαν (he says 'scribendum erat' not 'est', for he does not place the correction in the text). True enough, but this mistake is hard to explain, for in the previous lemma, §3, we find Αἰθιοπία, so that perseveration of Αἴγυπτω in §1, further away, is not very likely. For this reason we have followed Diels' example, too, daggered Αἴγυπτον and confined the correction to the apparatus.

e Other Evidence

'Es dürfte keinen zweiten Fall geben, daß ein Einzelproblem immer wieder mit allem Für und Wider von Herodot bis Ammianus Marcellinus in mehr oder minder geschlossenen Abhandlungen erörtert worden und soviel davon erhalten ist. Fünf größere Traktate besitzen wir noch ganz, oder wenigstens so weit, daß wir Anlage und Gedankengang überblicken: von Herodot, Aristoteles, Agatharchides, Seneca, Ailios Aristeides. Dazu kommen doxographische Zusammenstellungen verschiedener Art. ... Die Nilschwelle ist geradezu ein Schulbeispiel antiker doxographisch-zetematischer Literatur. Schon Herodot zeigt den Typus voll entwickelt ...' (Rehm 1936, 572).

Because of the opening formula *propter quid* = διὰ τί and the remark *ad finem* that the flooding of the Nile no longer seems to be a 'problem' (p. 197.2–3 R³ *non iam problema videntur esse* ~ *Anon. Phot.* p. 242.6 Thesleff/ps.Arist. fr. 246,

p. 189.9–10 R³ φησιν ὡς τοῦτο οὐκέτι πρόβλημά), it has been argued that *De inundacione Nili* belongs with the Aristotelian (or Peripatetic) *Problemata* genre; see various contributors at Mayhew (2015) 2–3 and 16–17. Several headings of Aëtian chapters, too, begin with, or contain, the formula διὰ τί (2.30, 5.9, 5.14, 5.18). The name-labels (six) *plus* patronymic (four) and ethnicon (four) that are present in the *opusculum* are as foreign to the *Problemata* literature as they are at home (when providing a first introduction) in doxographical literature and similar contexts. The *opusculum*, dealing with a particular issue (*zetema*) of a causal nature and including an overview of the related discussion, combines the technique of the *Problemata* literature with that of dialectic.

Rufini) *quid enim si temptemus exponere causam ascensionis Nili?* Isidore of Seville *de Nat.* capitul. 43 *De Nilo flumine* (heading in the body of the work: *De Nilo*).

§1 **Thales: Pomponius Mela** Chor. 1.53 (crescit ... sive quod) *aut venienti obviae adverso spiritu cursum descendantis impediunt*. **Diodorus Siculus** 1.38.2 Θαλῆς (fr. 82 Wöhrle) μὲν οὖν, εἰς τῶν ἐπτὰ σοφῶν ὀνομαζόμενος, φησὶ τοὺς ἐτησίας ἀντιπνέοντας ταῖς ἐκβολαῖς τοῦ ποταμοῦ κωλύειν εἰς θάλατταν προχεῖσθαι τὸ ρεῦμα, καὶ διὰ τοῦτ' αὐτὸν πληρούμενον ἐπικλύζειν ταπεινὴν οὖσαν καὶ πεδιάδα τὴν Αἴγυπτον. **Seneca** Nat. 4a.2.22 *si Thaleti* (fr. 100 Wöhrle) *credis, Etesiae descendanti Nilo resistunt, et cursum eius acto contra ostia mari sustinent: ita reverberatus in se recurrit; nec crescit, sed exitu prohibitus resistit, et quacumque mox potuit in se congestus erumpit*. cf. **Lucanus** 10.239–247 ... *Zephyros quoque vana vetustas / his ascripsit aquis, quorum stata tempora flatus / continuique dies et in aëra longa potestas, / ... / (244) vel quod aquas totiens rumpentis litora Nili / adsiduo feriunt coguntque resistere fluctu: / ille mora cursus adversique obice ponti / aestuat in campos*. **Diogenes Laertius** V.P. 1.37 τὸν Νεῖλον εἶπε (Thales 11A1 DK) πληθύνειν ἀνακοπτομένων τῶν ρευμάτων ὑπὸ τῶν ἐτησίῳ ἐναντίων ὄντων. **Anon. Florentinus** (FGrH647 F1) §1 Θαλῆς ὁ Μιλήσιος (fr. 560 Wöhrle), εἰς τῶν ζ' σοφῶν, φησὶ διὰ τοὺς ἐτησίας γίνεσθαι τὴν ἀναπλήρωσιν· πνεῖν γὰρ αὐτοὺς ἐναντίους τῷ ποταμῷ, καὶ τὰ στόματα κείσθαι κατὰ τὴν πνοὴν αὐτῶν· τὸν μὲν οὖν ἄνεμον ἐξ ἐναντίας πνέοντα κωλύειν τὴν ἔκβασιν τοῦ ποταμοῦ ἐκπίπτειν εἰς τὴν θάλασσαν, τὸ δὲ κύμα προσπίπτειν ἀντίον τοῖς στόμασι καὶ οὐρίον δὲ ἀνακόπτειν τὸν ποταμόν, καὶ (τὴν) ἀναπλήρωσιν οὕτως φησὶ γίνεσθαι τοῦ ποταμοῦ. **Ammianus Marcellinus** 22.15.7 *opinio est celebrior alia, quod spirantibus prodromis perque dies quadraginta et quinque etesiarum continuis flatibus repellentibus eius meatum velocitate cohibita superfusus fluctibus intumescit et reluctantē spiritu controverso adolescens in maius hinc vi reverberante ventorum, inde urgente cursu venarum perennium progrediens in sublime integit omnia et humo suppressa per supina camporum speciem exhibet maris*. **Scholia in Apollonium Rhodium** 4.269–271a, p. 277.3–7 Wendel Θαλῆς δὲ ὁ Μιλήσιος (fr. 571 Wöhrle) φησιν ὑπὸ τῶν ἐτησίῳ συναλαυνόμενα τὰ νέφη κατὰ τὰ ὅρη τῆς Αἰθιοπίας αὐτόθι ῥήγνυσθαι· ὅταν γὰρ τοῦ ποταμοῦ ἐξεναντίας συστῶσιν αἱ πνοαὶ προσπίπτουσιν τῇ θαλάσῃ, ἐκ τῆς ἀποπεμπομένης πλῆσμης τὰς ὑπερχύσεις ἀναδέχεσθαι τὸν Νεῖλον. **Isidore of Seville** Nat. 43.1–2 *Aegyptus aëris calore semper solem habet, numquam nubes vel imbres recipit. cuius loca Nilus fluvius aestatis tempore inundat, quem pro pluviis utuntur. oritur enim fluvius idem inter Austrum et ortum. Etesiarum autem flatu a Zephyri parte, id est ab occiduo, flant et habent certum tempus. nascuntur enim mense Maio. quarum flatu initio languens est, sed per dies augescit. (2) nam flant ab hora sexta in decimam*.

harum igitur flatu resistente undis, oppositisque etiam ostiis eius, quibus in mare influit, arenarum cumulis, Nili fluctus intumescunt ac retro reverti coguntur sicque aquae erumpentes propelluntur in austrum. quibus congestis, Nilus in Aegyptum erumpit; quiescentibus quoque Etesiis ruptisque arenarum cumulis, rursus in suum alveum redit fluuius. Etym. 13.21.7 hic apud Aegyptios Nilus vocatur propter limum quem trahit, qui efficit fecunditatem; unde et Nilus dictus est, quasi νέαν ἰλύν: nam antea Nilus Latine Melo dicebatur. apparet autem in Nilide lacu, de quo in meridiem versus excipitur Aegypto, ubi Aquilonis flatibus reperiussus aquis retroluctantibus intumescit, et inundationem Aegypti facit. Tzetzes Exeges. in Iliad. A. 426, schol. 85.13–15 Lolos Θαλής (—) ὁμοῦ καὶ Εὐ(θυ)μενῆς ἀνὴρ Μασσαλιώτης [sic; cf. below §2] / τοὺς ἐτησίας γράφοντες ἀναπληρῶν τὸν Νεῖλον / ἐκ τῆς θαλάσσης τῆς ἐκτὸς γλυκείας ὑπεργμένης.

§2 Euthymenes: Seneca Nat. 4a.2.22 Euthymenes Massiliensis testimonium dicit: 'navigavi', inquit, 'Atlanticum mare. inde Nilus fluit, maior quamdiu Etesiae statum tempus observant; tunc enim eicitur mare instantibus ventis. cum resederunt, et pelagus conquiescit minorque descendenti inde vis Nilo est. ceterum dulcis mari sapor est, et similes Niloticis belvae.' = **Ioannes Lydus Mens. 4.107.18–26** Εὐθυμένης δὲ ὁ Μασσαλιώτης φησὶ διαπλευσάσας τὴν Ἀτλαντικὴν θάλατταν, ἐξ ἐκεῖνης τε ἰδεῖν τὸν Νεῖλον ἐκτρέχοντα καὶ τότε μάλλον ὀγκοῦσθαι, ὅταν οἱ λεγόμενοι ἐτήσιοι πνέωσι· τότε γάρ φησιν ἐξωθεῖσθαι ὑπὸ τῶν ἀνέμων τὴν θάλατταν, τούτων δὲ παυομένων ἡσυχάζειν. γλυκὺ δὲ σχεδὸν τὸ τῆς Ἀτλαντικῆς θαλάττης ὕδωρ, καὶ ὅμοια (τὰ) ταύτης θηρία τοῖς τοῦ Νεῖλου. ἀντιλέγει δὲ καὶ ταύτῃ τῇ δόξῃ ὁ Σενέκας (sc. *Nat.* 4a.2.23–25) φάσκων κτλ. = **Ioannes Lydus Mens. 4.107.62–64** (excerpted from *Seneca Nat.* 4a, lost) ἀλλὰ καὶ Δικαίαρχος (fr. 113 Wehrli, 126 Mirhady) ἐν Περιόδῳ γῆς ἐκ τῆς Ἀτλαντικῆς θαλάττης τὸν Νεῖλον ἀναχεῖσθαι βούλεται. **Anon. Florentinus (FGrH647 F1) §5** Εὐθυμένης δὲ ὁ Μασσαλιώτης αὐτὸς πεπλευκῶς φησιν εἰς τὴν ἕξω θάλασσαν ἐπιρρεῖν ἕως εἰς τὴν Λιβύην ἐστραμμένην τε εἶναι πρὸς βορέαν τε καὶ ἄρκτους, καὶ τὸν μὲν ἄλλον χρόνον κενὴν εἶναι τὴν θάλασσαν, τοῖς δὲ ἐτησίαις ἀνωθουμένην ὑπὸ τῶν πνευμάτων πληροῦσθαι καὶ ῥεῖν ἔσω ταῖς ἡμέραις ταύταις, παυσάμενων δὲ τῶν ἐτησίων ἀναχωρεῖν. εἶναι δὲ αὐτὴν καὶ γλυκεῖαν, καὶ κῆτη παραπλήσια τοῖς ἐν τῷ Νεῖλῳ κροκοδείλοις καὶ ἵπποποτάμοις ἔχειν.

§3 Anaxagoras: Pomponius Mela 1.53 *crescit porro, sive quod solutae magnis aestibus nives ex inmanibus Aethiopiae iugis largius quam ripis accipi queant defluunt.* **Diodorus Siculus 1.38.4** Ἀναξαγόρας δ' ὁ φυσικός (—) ἀπεφήνατο τῆς ἀναβάσεως αἰτίαν εἶναι τὴν τηκομένην χιόνα κατὰ τὴν Αἰθιοπίαν, ᾧ καὶ ὁ ποιητὴς Εὐριπίδης μαθητὴς ὦν ἠκολούθηκε· λέγει γοῦν κτλ. **Seneca Nat. 4a.2.17** *Anaxagoras (59A91 DK) ait ex Aethiopiae iugis solutas nives ad Nilum usque decurrere. in eadem opinione omnis vetustas fuit: hoc Aeschylus (fr. 300 Radt) Sophocles (fr. 882 Radt) Euripides (fr. 228 Kannicht) tradunt.* = **Ioannes Lydus Mens. 4.107.7–11** περὶ τῆς ἐν θέρει τῶν ὑδάτων ἐπιδόσεως Ἀναξαγόρας φησὶ, τὰς τῆς Αἰθιοπίας τηκομένας χιόνας ἀποστέλλειν τὸν Νεῖλον. καὶ ταύτης ἐστὶ τῆς δόξης ὁ τ' Αἰσχυλὸς (fr. 300 Radt) καὶ Σοφοκλῆς (fr. 882 Radt) καὶ Εὐριπίδης (fr. 228 Kannicht). ὁ δὲ μέγιστος ἐν φιλοσόφοις Ῥωμαίοις Σενέκας (sc. *Nat.* 4a.2.17–21)

ἀντιλέγει κτλ. cf. **Lucanus** 10.219–220 *vana fides veterum, Nilo, quod crescat in arva, / Aethiopum prodesse nives*. **Hippolytus Ref.** 1.8.5 (on Anaxagoras, 59A42 DK) τὸν δὲ Νεῖλον αὖξασθαι κατὰ τὸ θέρος καταφερομένων εἰς αὐτὸν ὑδάτων ἀπὸ τῶν ἐν τοῖς ἀρκτ(ικ)οῖς χιόνων. **Anon. Florentinus** (*FGrH*647 F1) §2 Ἀναξαγόρας δὲ ὁ φυσικός (—) φησι τῆς χιόνος τηκομένης τὴν ἀναπλήρωσιν τοῦ Νεῖλου γίνεσθαι· ὡσαύτως δὲ καὶ Εὐριπίδης (fr. 228 Kannicht) καὶ ἕτεροί τινες τραγωιδῶν ποιηταί. ἀλλ' Ἀναξαγόρας μὲν αὐτὴν τὴν γένεσιν ποίησιν λέγει τῆς ἀναπληρώσεως, ὡς αὐτὸς εἴρηκεν, Εὐριπίδης δὲ καὶ τὸν τόπον ἀφορίζει, λέγων οὕτως κτλ. **Scholía in Apollonium Rhodium** 4.269–271a, p. 276.6–8 Wendel Ἀναξαγόρας (—) μὲν γάρ φησι διὰ τῆς χιόνος πληθύνει αὐτόν, ᾧ ἔπεται καὶ Εὐριπίδης λέγων κτλ. **Tzetzēs Exeges. in Iliad.** A.426, *schol.* 85.21–41 Lolos Ἀναξαγόρας (—) πάλιν δὲ μετὰ τοῦ Δημοκρίτου / καὶ τις ἀνὴρ Ἀρχέλαος ὁμοῦ καὶ Καλλισθένης / Αἰσχύλος (fr. 300 Radt) Εὐριπίδης (fr. 228 Kannicht) τε συντρέχουσιν Ὀμήρῳ (*Od.* 4.477 and 4.581) / σὺν τούτοις καὶ Διόδωρος ὁ ἱστοριογράφος (1.36.7–41.10) / ἐξ ὄμβρου καὶ χιόνος τε τῆς ἐν Αἰθιοπίᾳ / συντηκομένης λέγοντες κατάρδεσθαι τὸν Νεῖλον. / ὁ μὲν Αἰσχύλος οὕτως τοῖς στίχοις διαγράφων· κτλ. ... ταῦτ' αὖ φησιν Αἰσχύλος μὲν, ὁ δ' Εὐριπίδης λέγει· κτλ. ... ὁ δ' Ὀμηρος μονόστιχόν φησι βραχυλογία κτλ.

§4 **Democritus: Pomponius Mela** 1.53 (*crescit*) *sive quod per ea tempora flantes Etesiae aut actas a septentrione in meridiem nubes super principia eius imbre praecipitant, aut venienti obviae adverso spiritu cursum descendentes impediunt, aut harenis quas cum fluctibus litori adplicant ostia obducunt*.

Diodorus Siculus 1.39.1–3 Δημόκριτος δ' ὁ Ἀβδηρίτης (68A99 DK) φησὶν οὐ τὸν περὶ τὴν μεσημβρίαν τόπον χιονίζεσθαι, καθάπερ εἴρηκεν Εὐριπίδης (—) καὶ Ἀναξαγόρας (—), ἀλλὰ τὸν περὶ τὰς ἄρκτους, καὶ τοῦτο ἐμφανὲς εἶναι πᾶσι. τὸ δὲ πλῆθος τῆς σωρευομένης χιόνος ἐν τοῖς βορείοις μέρεσι περὶ μὲν τὰς τροπὰς μένειν πεπηγός, ἐν δὲ τῷ θερίῳ διαλυομένων ὑπὸ τῆς θερμασίας τῶν πάγων πολλὴν τηκεδὸνα γίνεσθαι, καὶ διὰ τοῦτο πολλὰ γεννᾶσθαι καὶ παχέα νέφη περὶ τοὺς μετεωροτέρους τῶν τόπων, δαψιλοῦς τῆς ἀναθυμιάσεως πρὸς τὸ ὕψος αἰρομένης. ταῦτα δ' ὑπὸ τῶν ἐτησίῳ ἐλαύνεσθαι, μέχρι ἂν ὅτου προσπέσῃ τοῖς μεγίστοις ὄρεσι τῶν κατὰ τὴν οἰκουμένην, ἃ φησὶν εἶναι περὶ τὴν Αἰθιοπίαν· ἔπειτα πρὸς τούτοις οὖσιν ὕψηλοῖς βιαίως θραυόμενα παμμεγέθεις ὄμβρους γεννᾶν, ἐξ ὧν πληροῦσθαι τὸν ποταμὸν μάλιστα κατὰ τὴν τῶν ἐτησίῳ ὥραν. **Anon. Florentinus** (*FGrH*647 F1) §4 Δημόκριτος (fr. 411 Luria) δὲ λέγει περὶ μὲν χειμερινὰς τροπὰς τοὺς περὶ τὰς Ἀρκτους χιονίζεσθαι τόπους, περὶ τροπὰς δὲ θερινὰς μεταστάντος τοῦ ἡλίου τηκομένης τῆς χιόνος καὶ ἀτμιζομένης ἀπὸ τῆς τήξεως νέφη γίνεσθαι, ἃ τοὺς ἐτησίας ὑπολαμβάνοντας φέρειν πρὸς μεσημβρίαν· συνωθουμένων δὲ τῶν νεφῶν ἐπὶ τὴν Αἰθιοπίαν καὶ τὴν Λιβύην ὄμβρον γίνεσθαι πολὺν, ὃν καταρρέοντα πληροῦν τὸν Νεῖλον. **Scholía in Apollonium Rhodium** 4.269 Δημόκριτος δὲ ὁ φυσικός (68A99 DK) *** ἀπὸ τοῦ κατὰ μεσημβρίαν ὑπερκειμένου πελάγους λαμβάνειν τὸν Νεῖλον τὴν ἐπίχυσιν, ἀπογλυκαίνεσθαι δὲ τὸ ὕδωρ διὰ τὸ διάστημα καὶ τὸ μήκος τοῦ πόρου καὶ ὑπὸ τοῦ καύματος ἀφεισόμενον· διὸ καὶ ἐναντίαν φησὶν ἔχειν τὴν γεῦσιν.

§5 **Herodotus: Pomponius Mela** 1.53 (*crescit*) *sive quod sol hieme terris propior et ob id fontem eius minuens tunc altius abit, sinitque integrum et ut est plenissimus surgere*. **Diodorus Siculus** 1.38.8–9 Ἡρόδοτος δὲ φησὶ τὸν Νεῖλον

εἶναι μὲν φύσει τηλικούτον ἡλικίος γίνεται κατὰ τὴν πλήρωσιν, ἐν δὲ τῷ χειμῶνι τὸν ἥλιον κατὰ τὴν Λιβύην φερόμενον ἐπισπᾶσθαι πρὸς ἑαυτὸν πολλὴν ὑγρασίαν ἐκ τοῦ Νείλου, καὶ διὰ τοῦτο περὶ τοὺς καιροὺς τούτους παρὰ φύσιν ἐλάττονα γίνεσθαι τὸν ποταμόν· τοῦ δὲ θέρου ἐπιστάντος ἀποχωροῦντα τῇ φορᾷ τὸν ἥλιον πρὸς τὰς ἄρκτους ἀναξηραίνειν καὶ ταπεινοῦν τοὺς τε περὶ τὴν Ἑλλάδα ποταμοὺς καὶ τοὺς κατὰ τὴν ἄλλην χώραν τὴν ὁμοίως ἐκείνῃ κειμένην. **Anon. Florentinus** (*FGrH*647 F1) §7 Ἡρόδοτος δὲ τοῖς μὲν λοιποῖς ὑπεναντία λέγει, παραπλησίως δὲ Οἰνοπίδῃ. τὴν μὲν γὰρ ῥύσιν τοῦ Νείλου φησὶ τοιαύτην ὥστε αἰεὶ πληροῦν τὸν ποταμόν, τὸν δὲ ἥλιον τοῦ χειμῶνος κατὰ τὴν Λιβύην ποιοῦμενον τὴν πορείαν ἀναξηραίνειν τὸν Νεῖλον, ἐπὶ δὲ τὰς θερινὰς τροπὰς μεθιστάμενον πρὸς τὴν Ἄρκτον ἰέναι. **Ioannes Lydus Mens.** 4.107.40–45 (excerpted from Seneca *Nat.* 4a, lost) ὁ δὲ Ἡρόδοτος παρὰ πάντων τῶν ποταμῶν ἔλκειν τὸν ἥλιον τὸ ὑγρὸν φησι τὴν πρόσγειον νότου ζώνην διατρέχοντα, πρὸς δὲ τῷ θέρει πρὸς βορρᾶν ἐκκλίνοντα ἐκκαλεῖσθαι τὸν Νεῖλον, καὶ διὰ ταύτην τὴν αἰτίαν αὐτὸν ἀναχεῖσθαι κατὰ τὸ θέρος. **confusedly Olympiodorus in Mete.** 109.3–6 ὁ μὲν οὖν Ἀριστοτέλης, ὥσπερ καὶ ὁ Πτολεμαῖος, φησὶ πηγὰς ἔχειν τὸν Νεῖλον· Ἡροδότῳ δὲ μᾶλλον πιστευτέον ἐντεῦθεν λέγοντι ἐκ τῆς ἀντοικουμένης ἔχειν τὴν ἀρχὴν αὐτόν· διὸ καὶ θέρους πλημμυρεῖ, ὅτε ἐκεῖσε χειμῶν. **Tzetzes Exeges. in Iliad.** A.426, *schol.* 85.16–20 Lolos ὁ Χῖος Οἰνοπίδης (*fr.* 11 Bodnár) δὲ σὺν ἅμα Ἡροδότῳ / πηγὰς φασι τὸν ποταμόν ξηραίνεσθαι χειμῶνι, / τῷ δ' ὁμβρίῳ ὕδατι τότε πληροῦσθαι μόνῳ / τῷ θέρει θερομένῃς δὲ μᾶλλον ἀναβλύζειν / ὁ Νεῖλος δ' οὐ βρεχόμενος ἤττων ἐστὶ χειμῶνι.

§6 **Ephorus: Diodorus Siculus** 1.39.7 Ἐφορος (*FGrH*70 F65e) δὲ καινοτάτην αἰτίαν εἰσφέρειν πιθανολογεῖν μὲν πειράται, τῆς δ' ἀληθείας οὐδαμῶς ἐπιτυχᾶνων θεωρεῖται. φησὶ γὰρ τὴν Αἴγυπτον ἅπασαν οὖσαν ποταμώχωστον καὶ χαύνην, ἔτι δὲ κισσηρώδη τὴν φύσιν, ῥαγάδας τε μεγάλας καὶ διηνεκεῖς ἔχειν, διὰ δὲ τούτων εἰς ἑαυτὴν ἀναλαμβάνειν ὑγροῦ πλῆθος, καὶ κατὰ μὲν τὴν χειμερινὴν ὥραν συνέχειν ἐν ἑαυτῇ τοῦτο, κατὰ δὲ τὴν θερινὴν ὥσπερ ἰδρώτας τινὰς ἐξ αὐτῆς πανταχόθεν ἀνιέναι, καὶ διὰ τούτων πληροῦν τὸν ποταμόν. **Scholia in Apollonium Rhodium** 4.269–271a, p. 277.1–3 Wendel Ἐφορος (*FGrH*70 F65d) δὲ ποταμώχωστον εἶναι φησι τὴν Αἴγυπτον, ῥηγινυμένης δὲ τῆς γῆς ὑπὸ τοῦ ἡλίου τῷ ἔαρι ἀναπηδᾶν τὸ ὕδωρ, καὶ ἐπαύξεσθαι τὸ ρεῦμα. **Ioannes Lydus Mens.** 4.107.45–48 (excerpted from *Nat.* 4a, lost) Ἐφορός (*FGrH*70 F65b) γε μὴν ὁ Κυμαῖος ἐν τῇ πρώτῃ τῶν Ἱστοριῶν φησιν, ἀραιὰν εἶναι κατὰ φύσιν τὴν Αἴγυπτον, καὶ κατ' ἔτος ἐπαγομένης ἰλῦος ὑπὸ τοῦ Νείλου στεγανοῦσθαι, τὸν δὲ ποταμόν δίκην ἰδρώτος κατὰ τὸν καιρὸν τοῦ καύματος ἐπὶ τὰ κουφότερα καὶ ἀραιότερα καταρρεῖν.

§7 **Eudoxus: Ioannes Lydus Mens.** 4.107.45–48 (excerpted from Seneca *Nat.* 4a, lost) οἱ δὲ Αἰγύπτιοι φασι, τοὺς ἐτησίους πάσας ἐξ ὑπερτέρου τὰς νεφέλας ἐπὶ τὸν νότον ἐξωθεῖν καὶ ἐκεῖθεν βαρείας καταφερομένης βροχῆς ἀναβλύζειν τὸν Νεῖλον. **Ammianus Marcellinus** 22.15.5–6 *affirmant aliqui physicorum in subiectis septemtrioni spatiis, cum hiemes frigidae cuncta constringunt, magnitudines nivium congelare easque postea vi flagrantis sideris resolutas fluxis umoribus nubes efficere gravidas, quae in meridianam plagam etesiis flantibus pulsae expressaeque tepore nimio incrementa ubertim suggerere Nilo creduntur.*

Commentary

A *Witnesses*

(1) The witnesses for P are restricted to P^B and P^Q (excepting some snippets in P^J). E in the final Book of the *PE* on the soul only includes chapters 4.4–5 of P, so 4.2 and 4.3 are absent from the *Praeparatio*, just like the rest of Book 4. (He announces these two chapters at *PE* 15.59.7, at the end of his much more generous abstracts from P's cosmological Books 2 and 3, claiming that they show that the Greeks did not even know what concerns their own persons, as is clear from their disagreements about the parts of the soul and the seat of its regent part.) The parallel to ch. 4.2 noted in the apparatus criticus is part of a ver-

batim quotation in E of Boethus of Sidon, and does not derive from P. G did not abstract P 4.2–7 between his chs. 89 and 90 where they would have belonged, only resuming this job after ch. 4.1 ‘On the rising of the Nile’ with P 4.8 ‘On sensation and sense-objects’. This entails that the *Placita* tradition proper concerned with the substance and parts and regent part and (im)mortality and (im)mobility of the soul is absent in this representative of P’s tradition. G omitted these six chapters presumably because he had already dealt with the soul and its properties in his composite c. 24 also entitled Περὶ ψυχῆς near the beginning of the *Historia philosopha*. The middle section of this earlier chapter deals with matters concerned with ethical issues such as the *liberum arbitrium*. The beginning and end sections contain some material parallel to respectively P 4.2, 4.3, 4.6, 4.7 and 4.4, and though doubtless filtered through a different tradition these passages are worth adducing; we cite a number of passages under section E(a) below.

(2) S has seven lemmata. In S five lemmata corresponding to five of P’s six are found right at the beginning of the very long chapter 1.49 Περὶ ψυχῆς, ‘On the soul’, in what looks like the same order at the top and the bottom of the list: P1 (Thales) = S 1.49.1a1; P2 (Pythagoras) = S 1.49.1a2. P3 (Plato) is absent. Again: P4 (Aristotle) = S 1.49.1a7; P5 (Dicaearchus) = S 1.49.1a5; P6 (Asclepiades) = S 1.49.1a7. In both sources, therefore, we have the order Thales–Pythagoras and Dicaearchus–Asclepiades. This is correct with regard to the two final lemmata, but the sequential correspondence of the first two lemmata is the accidental result of the sort of interventions we know as distinguishing traits of each of these two sources. P epitomized the original second lemma (Alcmaeon) away, so the third lemma (Pythagoras) automatically became P2, while S modified the order because apparently he wanted to place Pythagoras, the archegete of the Pythagorean Succession, next to Thales, the archegete of the Ionian Succession, so this lemma became S2. The Xenocrates lemma, also abridged away by P, then automatically became S3.

(2) S replaced the lemma extant in P as P3 (Plato) with *Phaedr.* 247c6–7 at *Ecl.* 1.49.2; P’s lemma is also extant in T, so this is one of the five significant cases of P and T in agreement against S (see General Introduction, section 2.5 with n. 42). S quite frequently replaces (or illustrates) lemmata with the name-label Plato by verbatim quotations, see Diels *DG* 75 n. 2, M–R 1.234–235, 1.249–254, 1.265–266, 2.1.140, 2.2.369, 3.311 n. 60, 3.378, and Jeremiah (2018) at M–R 4.286 and 353.

(3) From Book 4 T abstracted only chs. 4.2–5 and 4.7, passing over ch. 4.6. Because E did not copy out chs. 4.2–3, T cannot have used E as his source for P, although at *CAG* 5.16 (quoted above at *testes primi*) he announces the abstracts of ch. 4.2 following at 5.17–18 as belonging with what he has culled from ‘Plu-

tarch, Porphyry and Aëtius'. A, mentioned third, is his real source. Among the seven lemmata of T at CAG 5.17–18 pertaining to the matter of the present chapter, parallels to no less than five of P's six lemmata are found, in an overall order corresponding with and so confirming that of P. T omits P7 ~ S6 (Asclepiades). What is more, in the first and second blocks of lemmata he has actually preserved two items, namely §§2 and 4, that are not in P but also found in S. This again proves that T has used the source shared with S (the so-called T/S source) that turns out to be A. He has not interfered with the order of the lemmata (or the chapters), but considerably abridged them the way he usually does, except of course the already very short Xenocrates lemma (§4). See further below, ch. 4.3 Commentary A(5), and M–R 1.288 plus 1.296–298, and Mansfeld (2016 = 2018a) at M–R 4.180–187 on the T/S source (esp. 4.183 for ch. 4.2); further above, General Introduction, section 2.5.

(4) The text of Nemesius *NH* c. 2 is more complicated (cited at *testes secundi* above, and below, ch. 4.3, again at *testes secundi*). The first word of the chapter at p. 16.12 is διαφωνεῖται, which pertains to the dissensus on the subject of the soul among the ancients (and some of his contemporaries) in general. He begins with the corporealists and goes on with the incorporealists, whereas A's order is the opposite. The verbal parallels with P and S for ch. 4.2 at *NH* c. 2, pp. 16.13–17.10 are very striking, esp. for §§3–6 and are placed by Diels *DG* in his apparatus with T. This also holds for the parallels of *NH* c. 2, p. 16.16–21 with P and S for ch. 4.3, see ad loc. See the discussion at M–R 1.293–298, where we concluded that Nem shows dependence on A, which would make him a primary witness to the compendium. We now think that it is more likely that the relationship is not a direct one, but that both authors have used a wider tradition of the *Placita*. But see further on ch. 4.3, Commentary A(4).

Not only the corporealists disagree among themselves (Nem p. 16.15 διαφέρονται), but among the incorporealists there is even 'endless conflict' (p. 16.22, ἄπειρος ... διαφωνία): on the one hand you have Thales Pythagoras Plato, who posit that the soul is a substance and immortal (cf. A 4.7.1), and on the other those who posit that it is neither a substance nor immortal, namely Aristotle and 'Dinarchus', who make it un-substantial (ἀνούσιον). This unsubstantiality recalls the view of those who deny the existence of the soul according to some doxographical accounts; for this preliminary issue see the references at section E(b) General texts. In A's chapter the diaeresis is presented differently: §1 Thales, §2 Alcmaeon and §5 Plato posit that the soul is a substance, §3 Pythagoras and §4 Xenocrates that it is a quantity, and §6 Aristotle, §7 Dicaearchus and §8 Asclepiades that it is a quality.

(5) Ps.Justin here (corresponding to §§1–4) and in chs. 4.3–6 cites doxographical material on the soul that cannot be fully traced back to P (unlike in

chs. 1.3 and 1.7). Moreover, there is a close parallel for the material in chs. 4.2–3 in Hermias. It was noted by Diels at *DG* 261, who places the texts in parallel columns. It is also difficult to trace it back to A, e.g. the phrase ὕδωρ γονοποιόν which is found in both texts but not in the extant remains of A. We should therefore regard them both as *testes secundi*, as we have done above. Both texts are wholly lacking in name-labels.

B Proximate Tradition and Sources

(1) *Proximate tradition.* For the proximate tradition see the various and variously detailed accounts of e.g. Cicero *Luc.* 124, *Tusc.* 1.19–21; Philo *Somn.* 1.30; Tertullian *de An.* 3.2 (Soranus *de An.* fr. 2 Podolak), 5.1; and Macrobius *in Somn.* 1.14.19. To some extent these are dependent on earlier and richer versions of the tradition and include other topics, but extra material has also been incorporated subsequently: not only new doxai, but also earlier ones through retrograde contamination. The Ciceronian and Philonic parallels are particularly important because they prove the indebtedness of A to a shared *anterior* tradition, just as is the case in the next chapter (4.3), and in chs. 4.5, 4.7, and especially 4.9, where the parallels with Cicero show the same sort of dependence. (For Cicero as *testis secundus* see also above, chs. 1.3 and 1.7, and below, chs. 5.1–2 and 5.24–25). Tertullian *de An.* 5.1 is explicit about the opposition between incorporealists and corporealists: the latter claim that the soul is corporeal *e contrario* to the former. The contrast between incorporeal and corporeal substance is also exemplified in Philo of Alexandria, *Somn.* 1.30, in the context of his demonstration of the unknowability of the heavens and the soul. Wendland, who discovered and analyzed this passage, at (1897) 1095 argued this proves that Philo used Diels' *Vetusta placita*. In general see Mansfeld (1990a) 3065–3085 (Aëtius and a number of parallel passages), plus 3117–3121 (Philo) and 3126–3131 (Cicero); cf. above ch. 2.11, Commentary B, and below, chs. 4.3–4.5, each time at Commentary B. These extensive earlier parallels certainly demonstrate the importance of the anterior doxographical tradition. See also Philo *Cher.* 114, firing off a number of questions relating to the soul several of which are parallel to issues in A Book 4 (cited at Book 4 titulus et index above, and at the appropriate chapters below).

(2) *Sources.* The contrast between corporeal and incorporeal soul that to a large extent dominates the posterior tradition is already found in and derived from Arist. *de An.* 1.2; announced *de An.* 1.2 404b30–405a2, cited section E(b) General texts. Aristotle's dialectical account is also among the sources of several doxai. Two pairs of lemmata ultimately derive from Arist. *de An.* 1.2, though in reversed order and with noteworthy modifications: §§3–4 (Middle Platonist) Pythagoras–Xenocrates derive from *de An.* 1.2 404b16–30, where we have

in sequence Plato–anonymous thinkers (i.e. Xenocrates). §§1–2 Thales–Alcmaeon derive from *de An.* 1.2 405a19–21 plus 1.2 405a29–b1; at a first glance it is not clear whether Aristotle here presents Thales and Alcmaeon as corporealists or incorporealists (no mention of water for Thales, and no material principle at all for Alcmaeon), so a literalist doxographer could prefer the latter, though elsewhere of course Aristotle always presents Thales as a corporealist. Aristotle's note on Alcmaeon has not been modified as strongly as the note on Thales, or as the passage on Plato and an anonymous follower, which became Pythagoras plus (correctly) Xenocrates. The Plato lemma at §5 does not echo Aristotle's description at *de An.* 1.2 404b16–29; when this had been linked *ad sententiam* with the name-label Pythagoras, a new doxa was needed for Plato. This new doxa summarizes *Tim.* 35a–36b (World Soul) plus, to some extent, 41d (human souls). The corporealists Diogenes and Heraclitus, listed *de An.* 1.2 405a21–29 between Thales and Alcmaeon, are represented by lemmata in the complementary chapter, A 4.3, *ubi vide*.

The emphasis on self-motion in §§3–5 may be explained by the influence of the Early Academy, with its interest in Pythagoreanism. Xenocrates' self-moving number and so Plato's self-moving soul were retrospectively and creatively linked with Pythagorean number theory, see Burkert (1972) 63–64, 272 n. 165.

C Chapter Heading

There are no variants for the heading in Greek as found in P^{BS} and alluded to at T 5.16, τίνα περὶ ψυχῆς οἱ πολυθρύλητοι τῶν φιλοσόφων ἐδόξασαν. It is a representative of the umbrella type (περὶ τοῦ δεῖναι) that dominates in the *Placita* (see above, ch. 1.3, Commentary C). Q's heading 'Was ist die Definition der Seele?' possibly translates a longer Greek title, e.g. Περί ψυχῆς τί ἐστίν, but it is more likely that in the manner of Arabic translators he amplified the wording for didactic reasons. It is also possible that he anticipates the fuller heading of the next chapter. Accordingly there is insufficient support for including this added phrase in our text. Περί ψυχῆς is quite familiar as a book-title. Think of Aristotle's reference to his own treatise, e.g. *GA* 5.7 786b25, or Callimachus' reference to Plato's *Phaedo* by what became its standard second title (fr. 23.3–4 Pfeiffer). For the numerous issues it is capable of comprising (so to speak the whole of 4.2–23) see above, Introduction to Book 4. In the present chapter, as it turns out, it comprises incorporealist views and the question types, or categories, of substance and quality as well as the category of quantity, while the long heading of the next chapter explicitly refers to both substance and corporeality.

D *Analysis*

a Context

The chapter follows after the last of the cosmological chapters, 4.1 'On the Nile'. It is the first of the twenty-two chapters dealing in a rather firm systematic order with the human soul from various systematic points of view, and the first of a cluster of seven dealing with the soul *per se*. The presentation of these psychological issues largely conforms to an originally Aristotelian order of treatment, see Baltussen (1993) 205–206, and (2000a) 228–230, and M–R 2.1.37, 2.1.138–150 on A's chapters on the soul and the senses. Themes discussed more or less simultaneously by Aristotle (such as substance, motion and cognition) are however separated more neatly and scholastically in the *Placita*. Cicero *Tusc.* 1.19–21, an early representative of the wider doxographical tradition, treats the themes of the soul's substance (cf. A 4.1–2), its mortality versus its immortality (cf. A 4.7), and the location of its regent part (cf. A 4.5) simultaneously, and so does his near contemporary Philo of Alexandria, *Somn.* 1.30–33. Our *Placita* separates these themes rather rigorously, as is clear from the chapter headings and the chapters themselves. But there are traces of a less rigorous dissociation. In ch. 4.2, on the substance of soul qua incorporeal, Alcmaeon's soul is said to be immortal (4.2.2 ἀθάνατον), thus anticipating the theme of ch. 4.7. Also note that the various references (no less than five) to movement at ch. 4.2.1–5 anticipate the theme of ch. 4.6 (in the next chapter the role of movement, referred to only once at ch. 4.3.11, is incidental), and recall Aristotle on his predecessors' account of the soul as principle of movement in *de An.* 1.2. The surmisal that the anterior doxographical treatment attested by Cicero (see below, section D(e)) and Philo may have been rather less scholastic is unavoidable. A somewhat similar sequence of themes is found in Lucr. *DRN* Books 3–4, see Schrijvers (1999) 40–42, 122–123, M–R 2.1.144–145 and in general above, Introduction to Book 4.

Several doxai of ch. 4.2 are summarized by means of catchwords in the first lemma of 4.3, found in P only, see Diels' note ad loc., *DG* 387. The lists of the doxai on the nature of the soul of the incorporealists (ch. 4.2) is immediately followed by that of the corporealists (ch. 4.3). The diaphonia could have been accommodated in a single chapter, as is in fact the case in other sources (e.g. Nemesius *NH* c. 2), and also at S 1.49.1a + 1b, where the subdivision has been introduced by Wachsmuth. Chapters 4.2 plus 4.3 thus constitute a single unit. There are other examples of twinned chapters in Book 4, e.g. ch. 4.11 plus ch. 4.12, two chapters dealing with aspects of Stoic views of sensation and concept formation, or ch. 4.13 plus ch. 4.14 on vision and mirror images. Also compare, in Book 1, chs. 1.21–22 on time, chs. 1.25–26 on necessity, and chs. 1.27–28 on fate.

b Number–Order of Lemmata

The order as reconstructed turns out to be the same as that of Diels in the *DG*. The opening lemma comes first in P, S, and T, as also in the parallel account in Nem; this is due to the well-known *πρῶτος εὐρετής* motif (M–R 2.1.95–96), explicitly acknowledged. Thales may have come first in A for chronological reasons too, see M–R 2.1.73–96 and Jeremiah (2018) 310–319. The order of S is rather different from that of P and T, who are very close to each other. It is apparent that P did not interfere with the order, but abridged away two lemmata, the content of which is similar to that of the lemma that each time came before it, so could be considered as equivalent attachments one could dispense with: in the block §§1–2 soul according to Alcmaeon at §2 is self-moved just as according to Thales at §1, and in the block §§3–4 Xenocrates at §4 agrees with Pythagoras at §3. S's modifications of the order can be explained (see also at section A above): he wished to have Pythagoras, one of his favoured authorities, next to Thales, thus also paying homage to absolute chronology. This move brought the Xenocrates lemma along. S left out the Plato lemma §5 in favour of an almost verbatim quotation of *Phaedr.* 247c6–7 at *Ecl.* 1.49.2. The now isolated Aristotle lemma §6 was moved to the end in S, thus anticipating the position of the incomplete Aristotelian formula at the end of the summary of ch. 4.2 at 4.3.1, a lemma omitted by S. T has preserved the original order of block §§1–2, so also left the block §§3–4 in its original location. He omitted the final lemma, Asclepiades.

c Rationale–Structure of Chapter

The chapter deals with the question-types ‘what is it?’ and ‘how is it?’, or the categories of substance, quantity and quality, and provides several answers. This derives from Aristotle's agenda, see *de An.* 1.1 402a7–8: ‘the aim of our inquiry is to study and understand its (sc. the soul's) nature and substance, and secondly its accidents’, and 1.1 402a23–26: ‘presumably we first need to establish to which of the genera it belongs and what it is, I mean a particular thing and a substance, or a quality, or a quantity (*πότερον τόδε τι καὶ οὐσία ἢ ποιὸν ἢ ποσόν*), or any other item on the list of categories’. See above, section D(a), Introduction to Book 4 section 2(1), and General Introduction section 5.2.1. Compare also cf. M–R 2.1.140–141.

As is clear from the contents of the doxai and the (incomplete but) explicit summary at ch. 4.3.1, it comprises a selection of incorporealist doctrines that are opposed to the corporealist doctrines found in the next chapter, 4.3. These two chapters are analysed at Mansfeld (1990a) 3065–3085 and compared with the wider tradition (esp. Cicero) *ibid.* 3122–3131 and 318–3121 (Philo). In its present form the opposition between incorporealists and corporealists (which

recalls that between the materialists and the Friends of the Forms in Plato's *Sophist*, 245e–249d) derives from Aristotle, as announced *de An.* 1.2 404b30–31 and then worked out in the rest of this chapter of the *De anima*. See Mansfeld (1990a) 3072, 3204, M–R. 2.1.57–58. It is found in numerous dialectical-doxographical parallels, see e.g. Mansfeld (1990a) 3065–3085, and below, section E(a) & (b). §5 Aristotle provides a smooth transition from the incorporalists at §§1–4 to those of §§6–7 because the soul is the actuality of the *body*. §§6–7 Dicaearchus and Asclepiades are well placed at the end of the whole incorporeal series, because their views of the soul as a quality of (or supervenient on) the *body* are somewhat closer to those of the corporealists in the next chapter, 4.3.

The series from Thales to Asclepiades virtually covers the entire time span dealt with in A's treatise, but the chronological order is interrupted for systematic reasons, viz. by the position of §2 Alcmaeon before §3 Pythagoras and of §4 Xenocrates before §5 Plato.

A diaeresis concerned with motion divides the chapter in two main parts, opposing the block of §§1–5, which stress self-motion, to that of §§6–8, which do not refer to motion. The theme of the soul's motion occurs again as that of ch. 4.6. Within the first block §§1–2, which make the motion everlasting, are opposed to §§3–5, which do not do so. The emphasis on motion in the first part of ch. 4.2 to some extent echoes Aristotle's discussion at *de An.* 1.2, where the main diaeresis is between those who make the soul the principle of motion and those who make it the principle of cognition, and where he begins with the former. For the latter in A see chs. 4.8–12 below. The negative characteristic of §§4–6 (implicitly spreading to §§7–8) relates to Aristotle's argument against soul-motion at *de An.* 1.3, summarized at A 4.2.6. The doxographer takes the traditional question 'what is the soul?' in hand by arranging blocks of lemmata in succession according to the Aristotelian categories: of substance, §§1–2; of quantity, §§3–4; and of quality, §§6–8—thus conforming to the master's checklist at *de An.* 1.1 402a22–25. A compromise or bridge position (cf. M–R 2.1.9–10, 2.1.46, 2.1.57, 2.1.59, 2.1.141, 2.1.187, 2.1.190) is occupied by §5, which combines the categories of substance and quantity. The series of lemmata as a whole is ordered according to quantity in a different way as well, viz. by number: the substances, quantities, and quality at §§1–6 are each counted as one, while at §7 the number four (explicitly) and at §8 the number five (implicitly, but explicitly in the parallels in e.g. ps.Galen *Definitiones medicae* and Macrobius) make their appearance.

d Further Comments

General Points

The terminology concerned with motion used by A repays a closer look. The doxographer seems to have given some thought to *variatio*: §1 ἀεικίνητον ἢ αὐτοκίνητον, §2 αὐτοκίνητον κατὰ αἰδίον κίνησιν, §3(–4) ἑαυτὸν κινούντα, §5 ἐξ ἑαυτῆς κινήτην. The word ἀεικίνητος occurs for the first time at Plato *Phdr.* 245c and is a *hapax* in his oeuvre; it does not occur in Aristotle. In A it is once found in the present chapter and once at ch. 4.6.1 (and, a rare exception, it is absent from Diels' index in the *DG*). The reading αὐτ[οκ]εῖνητον in *Phdr.* 245c of the *prima manus* at *POxy* 1017 col. xx.5–6, accepted by Robin in the Budé ed. of the dialogue, was corrected by the *secunda manus* to ἀεικίνητον. In his commentary on the papyrus Haslam (1999) 265–267 once and for all proves the *diorthotes* to be right. The word αὐτοκίνητος occurs for the first time at Aristotle *Phys.* 8.5 258a2, and is a *hapax* in his oeuvre. It occurs twice in the present chapter (and is cited from this chapter at 4.3.1), but not elsewhere in the *Placita*. We may assume that entered the tradition because of the phrase τὸ αὐτὸ κινούν occurring in the immediate vicinity, *Phdr.* 245c.

Individual Points

§§1–2 Porphyry *ad Gaur.* 70F Smith at Simp. in *Cat.* 213.12–17 cites 'soul is a substance that is self-moved' (ψυχὴ ἐστὶν οὐσία αὐτοκίνητος) as an instance of an essential definition (one of the set of οὐσιώδεις ... ὅροι), or definition of the essence or substance (οὐσία).

§1 The ascription to Thales of 'everlasting motion or self-motion' is in fact the attribution to him of an as to vocabulary modernized (and of course drastically abridged) version of Plato's argument at *Phdr.* 245c–d. This transfer could be achieved because Thales is the archegete of the Ionian Succession (cf. M–R 2.1.74–96 and below ch. 4.7 Commentary D(d)§1). The Ionian Succession includes Plato, to whom as we saw self-motion (ἐξ ἑαυτῆς κινήτην) is attributed at §5, and everlasting motion (ἀεικίνητον) at ch. 4.6.1. (We note in passing that the *Placita*, just as *POxy* 1017 col. xx.5–6 *secunda manus*, does not attribute the term αὐτοκίνητος to Plato.) Influence has also been exercised by amalgamating the creative interpretation of the ensouled loadstone of *de An.* 1.2 405a19–21 with a creative interpretation of Aristotle's cautious suggestion (note ἔσως, 'presumably') that Thales said that 'everything is full of gods' because like 'some people, he probably believed that the soul is intermingled with the whole universe' (*de An.* 1.5 411a7–8). The soul of the loadstone thus takes over the universe, cf. M–R. 2.1.178–179. See also below, ch. 4.3 Commentary D(d)§14.

The inclusion of Thales among the incorporealists contrasts with the traditional attribution to him of water as the element and principle, as at ch. 1.3.1,

and therefore excludes him from ch. 4.3.9, where only Hippo is left. That Thales' soul is incorporeal is explicitly argued by Simplicius (perhaps Priscianus) in *de An.* 31.20–26. So our lemma ch. 4.2.1 seems to anticipate the interpretation Simplicius(?) formulates, or rather cites, five centuries later. John Philoponus, who thoughtlessly copies a traditional list at *in de An.* 9.7–11 (οἱ δὲ ἐξ ὕδατος, ὡς Θαλῆς καὶ Ἰππῶν ὁ ἐπίκλην ἄθεος) which attributes the concept of a soul consisting of water to Thales, later on in his commentary cautiously argues that Aristotle avoided to attribute to Thales the view that the soul consists of water (*in de An.* 86.22–34). Yet the theological doxa attributed to Thales at ch. 1.7.2 endows the principle water with a (Stoicizing) divine motive power (διήκειν δὲ καὶ διὰ τοῦ στοιχειώδους ὑγροῦ δύναμιν θείαν κινητικὴν αὐτοῦ). This is consistent with the doctrine of ch. 4.2.1. As to the principle or element, the Thales of the *Placita* to whom an ever-moving or self-moving soul, or motive divine power, is attributed has clearly been promoted to a higher level. This cannot be the invention of the doxographer, who here undoubtedly relies on an interpretative commentary tradition of which in this way we catch a glimpse. The difference of opinion among the late commentators is significant and suggests that their dispute had a long history; the texts are quoted below, section E(b)§1.

§2 The Alcmaeon lemma closely follows Aristotle at *de An.* 1.2 405a29–b1, cf. Mansfeld (1990a) 3078 n. 80, 3090, Baltussen (1993) 219, and now Mansfeld (2015b). As a matter of fact, the gist of its second clause (about the soul's immortality and resemblance to the gods) would be in a more appropriate position in ch. 4.7, heading 'On the indestructibility of soul'. Though the term αὐτοκίνητος, not paralleled in Aristotle, was added, in other respects the excerpt retained its original extent, thus attesting the tenacity of the tradition. Parallel echoes are at Cicero *ND* 1.27, and Boethius at Porph. *de An. adv. Boeth.* (243F Smith) at Eus. *PE* 11.28.9 (cited in the apparatus criticus at §2 above). Also cf. Diogenes Laertius *V.P.* 8.83 *ad finem*: 'Cette brève doxographie sur l'âme semble très dépendante d'Aristote, *De l'âme*, I 2, 405 a 29–b 1' writes J.-F. Balaudé ad loc., Goulet-Cazé (1999) 1009. Whether Aristotle correctly reflects Alcmaeon's thought is maybe doubtful, because the reason he gives is so very Aristotelian: the soul is immortal because the 'things divine, the moon, the sun, the stars, and the whole heavens are in a state of perpetual motion (κινεῖσθαι αἰεῖ)'. At any rate Aristotle's θεία shows that Diels' conjecture θεοῖς is not good; Diels presumably forgot about or missed the relation of the lemma to Aristotle's sentence. What is more, immediately before the Alcmaeon passage Aristotle speaks of Heraclitus' principle as always moving: it is in 'perpetual flux' (*de An.* 2.1 405a27, ῥέον αἰεῖ)—an interpretation of Heraclitus' thought, also found with Plato, that is not universally accepted today. The attribution of perpetual motion is one of the reasons for the incorporation of Alcmaeon's doxa in ch. 4.2, since perpetual

motion and self-motion are (*more platonico*) believed to be equivalent in §1. Thus, on the basis of Aristotle's note Alcmaeon was interpreted as having anticipated Plato already in antiquity, and not only by modern scholars who add to this note the *placitum* deriving from his treatment as independent and so corroborative evidence. See e.g. Alcmaeon 14A10 DK³ = 24A12 DK⁵, Zeller–Nestle (1919) 599 n. 1, Guthrie (1962–1981) 1.351, Barnes (1981) 117–118; contra Mansfeld (2015b).
